Performance Comparison of Platinum SuperFi II and Platinum SuperFi DNA Polymerases

For Research Use Only. Not for use in diagnostic procedures.
Platinum SuperFi II DNA Polymerase in Comparison to Platinum SuperFi DNA Polymerase

• Comparable benefits:
  • Same enzyme with exceptional >300x Taq fidelity
  • High yield, specificity, sensitivity, and benchtop stability

• Improved benefits:
  • Universal annealing temperature for different primer sets
  • Co-cycling of PCR targets of different lengths
  • More robust amplification of 20–40 kb sequences
  • Enhanced performance in GC-rich PCR (supplementary enhancer not required)
  • Increased tolerance to common PCR inhibitors

$T_m$ calculator no longer needed
Comparable Benefits
With its extremely low error rate, Platinum SuperFi II DNA Polymerase offers the highest level of confidence for preserving DNA sequence accuracy.
Comparisons of Yield, Specificity, and Sensitivity

High yield, specificity, and sensitivity in detection of target DNA

Comparable PCR performance in amplification of human genomic DNA (gDNA).

A 2 kb fragment from 0.4, 2, 10, 50, and 250 ng of human gDNA was amplified, using Platinum SuperFi II and Invitrogen™ Platinum™ SuperFi™ DNA Polymerases according to their recommended protocols. The estimated copy number is ~100 copies per 0.4 ng of human gDNA. The molecular weight marker is Invitrogen™ TrackIt™ 1 Kb Plus DNA Ladder.

High PCR yield, specificity, and sensitivity was obtained with both Platinum SuperFi II and Platinum SuperFi DNA Polymerase.
Stability of Assembled Reactions

Reactions of Platinum SuperFi II DNA Polymerase and Platinum SuperFi II DNA Polymerase are comparably stable at room temperature after setup.

Comparable stability of reactions assembled with Platinum SuperFi II and Platinum SuperFi DNA Polymerases.

Reactions were set up and incubated at room temperature for 0 hr or 16 hr before loading in the thermal cycler. The same experiment run with NEB™ Q5™ Hot Start High-Fidelity DNA Polymerase is shown for comparison.

High benchtop stability for high-throughput applications
Improved Benefits
Efficient PCR amplification at both universal and calculated annealing temperatures.

Sequences of a bacterial plasmid, human gDNA, and lambda DNA were amplified by PCR with Platinum SuperFi II DNA Polymerase, following a universal annealing temperature at 60°C or their calculated primer annealing temperatures.

Both the universal annealing at 60°C and the calculated annealing temperature can be used for PCR with Platinum SuperFi II DNA Polymerase.
PCR Co-Cycling of Different Targets

Platinum SuperFi II DNA Polymerase

Universal protocol for different PCR targets

Enabling co-cycling of short and long amplicons together.

0.7 kb, 2.0 kb, 4.8 kb, and 14 kb fragments were amplified from 100 ng of human gDNA using the same protocol for all four targets. Extension time of the longest amplicon (7 min at 72°C) was used without compromising PCR specificity.

Different PCR assays can be cycled together using the same universal protocol with Platinum SuperFi II DNA Polymerase, allowing significant time savings.
Amplification of Long Sequences

Amplification of DNA sequences up to 20 kb.

Two 20 kb fragments from 200 ng of human gDNA were amplified using Platinum SuperFi II and Platinum SuperFi DNA Polymerases, following their recommended protocols.

Amplification of long DNA sequences is more achievable with Platinum SuperFi II DNA Polymerase.
Amplification of GC-Rich Targets

Sequences with high GC content are amplified with high specificity and yield using Platinum SuperFi II DNA Polymerase without supplementary GC enhancers or additives.

Robust amplification of high-GC targets

Enhanced amplification of sequences with high GC content.

Four targets of high GC content were amplified from 50 ng of human gDNA. No supplementary additive was required for Platinum SuperFi II DNA Polymerase, whereas Platinum GC Enhancer was used for Platinum SuperFi DNA Polymerase.
Tolerance to Common PCR Inhibitors

Increased tolerance to common PCR inhibitors is observed with Platinum SuperFi II DNA Polymerase.

Higher tolerance to common PCR inhibitors.

A 2 kb fragment was amplified from 50 ng of human gDNA using Platinum SuperFi II and Platinum SuperFi DNA Polymerases.

**Reaction mixtures contained:**

1 – no inhibitor
2 – humic acid (4 µg/mL)
3 – hemin (20 µM)
4 – bile salt (1 mg/mL)
