

Transforming your plant design with low head loss sampling

Any experienced engineer knows the operational benefits of keeping slurry transport to a minimum, but for designers the most pressing issue may be head loss. The pressure drop over transport and sampling systems can mean adding height to a plant or cost and complexity in the form of pumped circuits.

Our dedicated slurry sampling and analysis stations eliminate these issues, delivering online slurry analysis with minimal head loss thereby reducing construction costs, project timelines and operating costs.

Thermo Scientific™ MSA-330 XRF Analyzer
