

## **FT-Raman Forensic Library**

### *Library Listing – 175 spectra*

This library is designed to assist forensic scientists and investigators for fast and easy identification of common street drugs. It contains a collection of 175 common drugs and related compounds frequently encountered in forensic analysis.

The FT-Raman Forensic Library contains spectra of controlled substances, common contaminants, and “cutting” agents. The Raman technique provides a unique benefit in forensic science since sample analysis can be completed directly through plastic bags and glass containers.

To create the Aldrich FT-Raman Forensic Library, 175 compounds of interest were placed in glass containers and were excited with an Nd:YVO<sub>4</sub> laser (1064 nm) using laser powers between 100 mW, measured at the sample. A Thermo Scientific FT-Raman spectrometer (with a Ge detector) was used to collect the Raman spectra. The spectra were saved in Raman Shift format.
