

Orbitrap Exploris™ Isotope Solutions: Isotope Fingerprints

Darren Tollstrup

Issaku Kohl, Nils Kuhlbusch, Andreas Hilkert, Dieter Juchelka

 The world leader in serving science

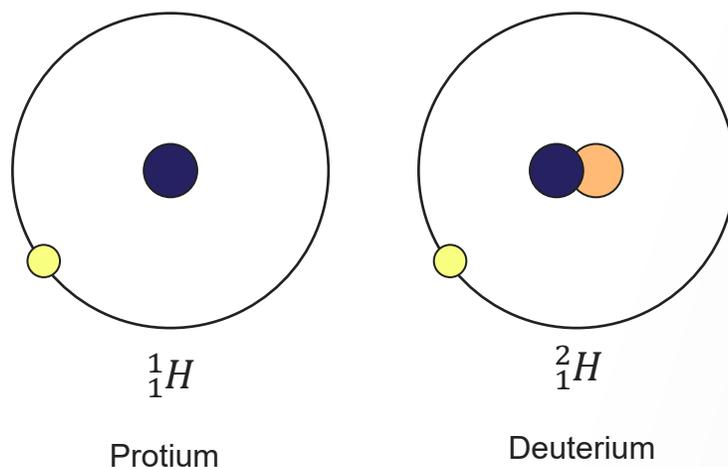

Isotope Ratios as Fingerprints

- Materials have a unique chemical signature that allows them to be identified using untargeted and targeted analysis.
- Isotope Ratio Mass Spectrometry (IRMS) is used to measure the stable isotope ratios of specific elements and compounds: “super-targeted” analysis.

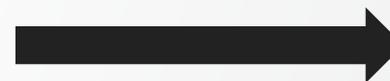

Isotope Ratios as Fingerprints

- Atoms consist of protons (+), neutrons (N), and electrons (-)
- Atoms of the same element always have the same number of protons, but may have different numbers of neutrons
- Atoms of an element with different numbers of neutrons are called **isotopes**
- Isotopes can be radioactive (they transform with time to other isotopes) or stable -> **we focus on stable isotopes**

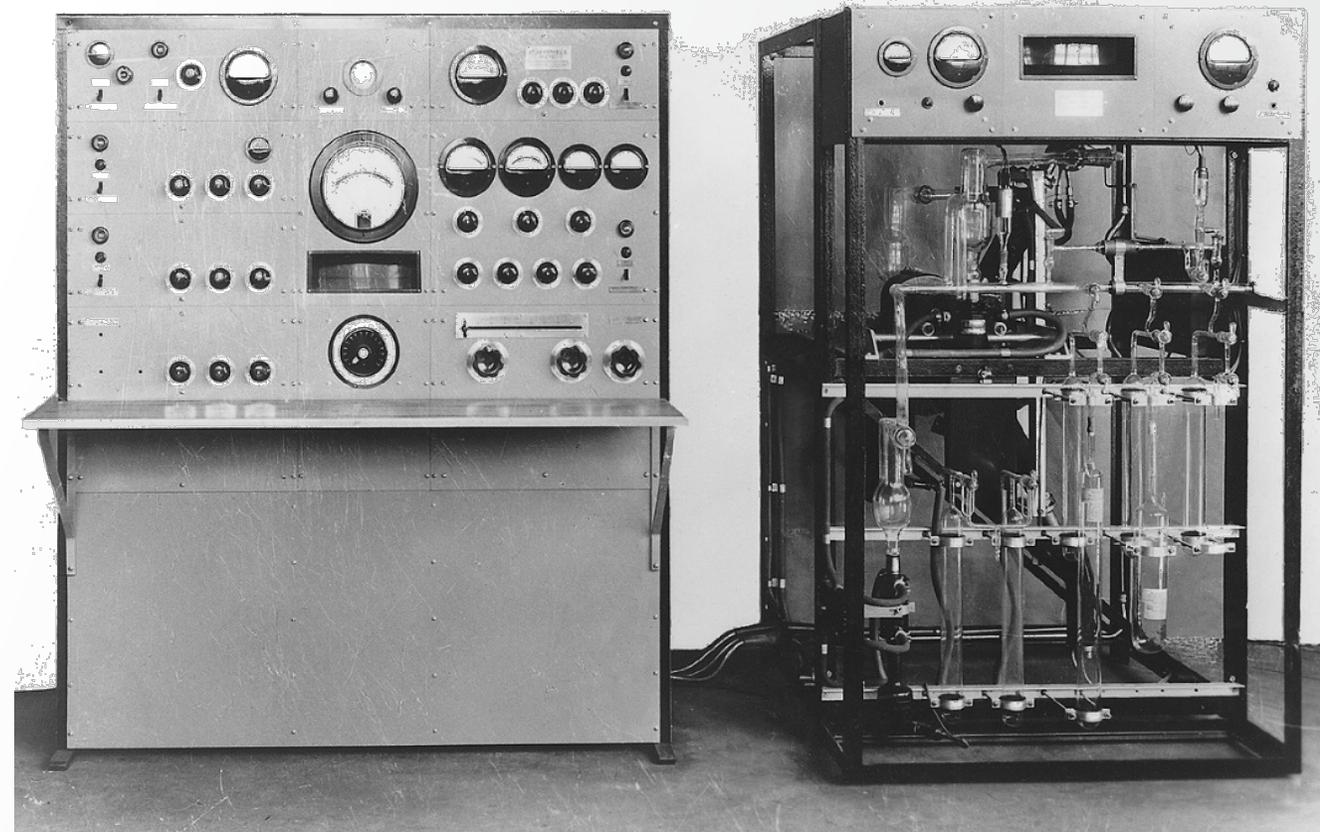

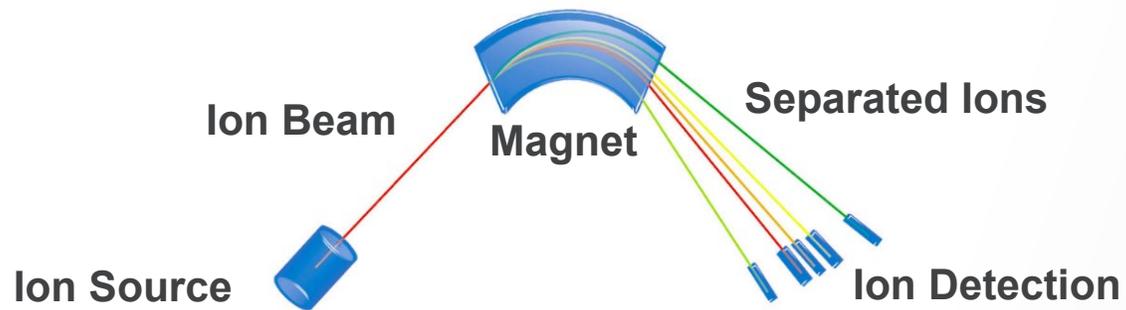

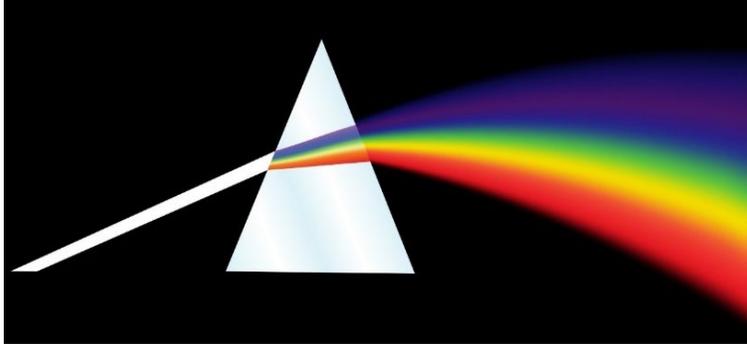

${}^2\text{H}/{}^1\text{H}$ ratio

Isotope Fingerprints

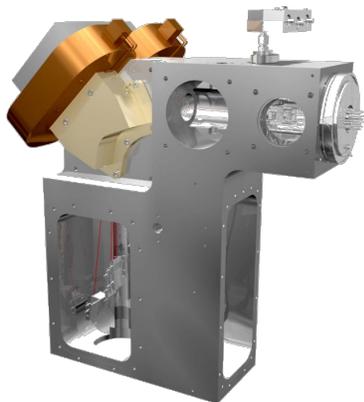

Isotope Ratio Mass Spectrometry

CH3 IRMS (1950)

The current Thermo Scientific™ gas IRMS portfolio

- **Thermo Scientific™ DELTA Q™ IRMS**
- Sensitivity up to 800 M/I
- Mass range up to m/z 96
- Accommodates up to 10 collectors

- **Thermo Scientific™ 253 Plus™ 10 kV IRMS**
- High-precision isotope analysis
- Long term stability and robustness
- Complete automation for ease-of-use

- **Thermo Scientific™ Ultra™ HR-IRMS**
- Double-focusing magnetic-sector mass analyzer
- Variable collector array
- Dual viscous flow inlet systems
- Optional (Multi) Ion Counting and RPQ

Mass spectrometers for isotope ratio analysis

Classic isotope-ratio MS N_2, O_2, N_2O

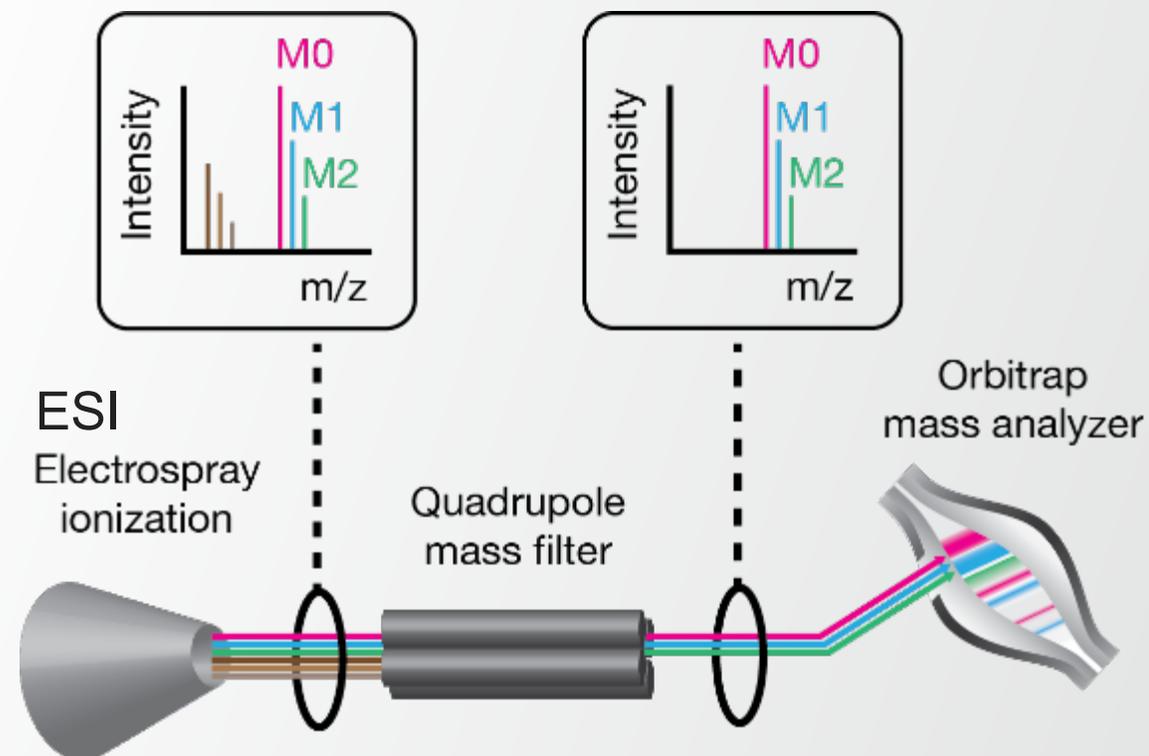

- **Indirect:** Conversion into **simple gases**
- Combining isotopologues on **few signals**

Thermo Scientific Orbitrap™ MS

- **Direct:** Intact isotopologues
- Separation of **all species** by HRMS

Orbitrap Exploris Isotope Solutions

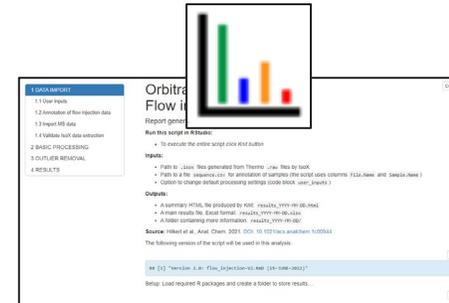

Thermo Scientific™ Orbitrap Exploris™ Isotope Solutions includes:

Thermo Scientific™
Orbitrap Exploris™
120/240/480 MS

Dual Syringe Inlet

Data evaluation Package
for Isotope Ratio MS

Optional Thermo
Scientific™ Vanquish™
Neo UHPLC System

Oxyanions: refine understanding of element cycling

Atmosphere

Soil

Water

Oxyanions are important chemical constituents of virtually every environment on Earth.

What's inside the Orbitrap Exploris MS

Essential components for isotope ratio analysis

1. ESI Source

Electrospray Ionization

2. Advanced Quadrupole

m/z Range Selection

3. Orbitrap Mass Analyzer

Image Current Detection and FT Analysis

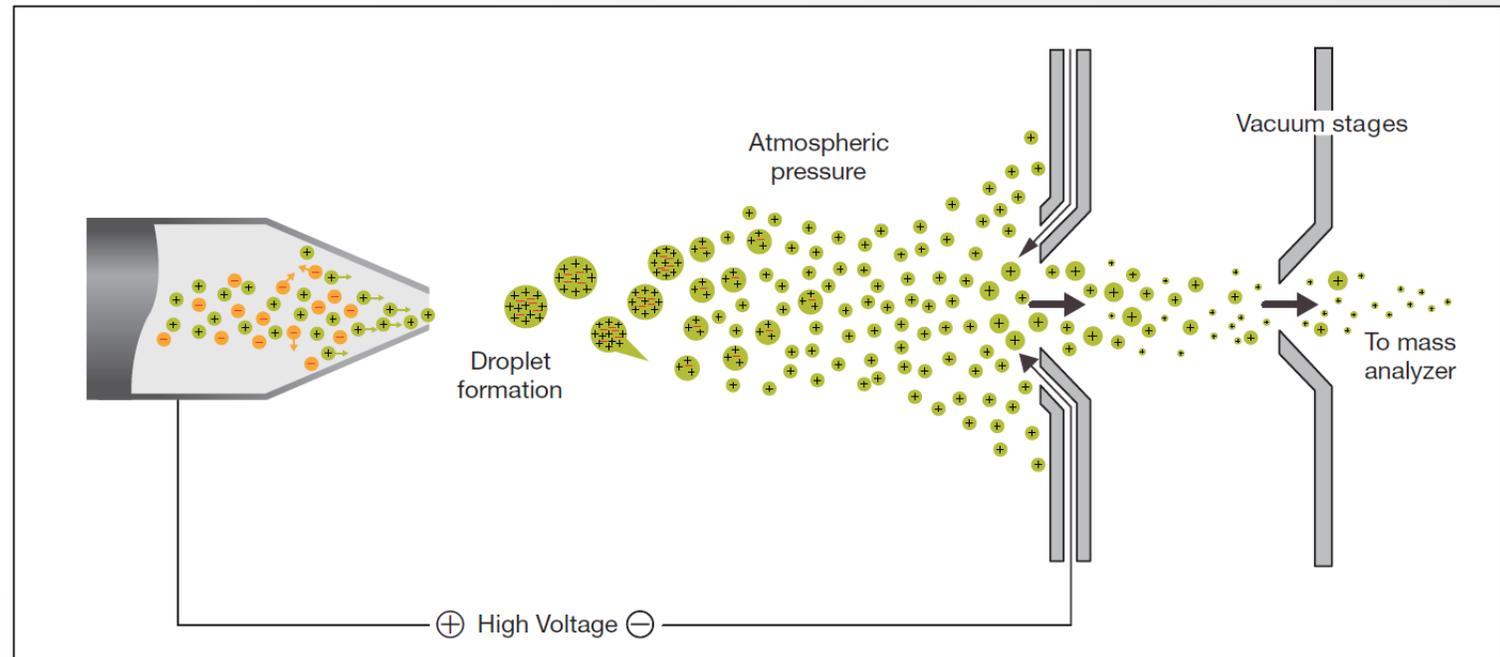

Electro Spray Ionization (ESI)

Ionization source:

1. Ionization of target molecules in liquid phase
2. Transfer of intact molecular ions to the gas phase
3. Transfer into the MS

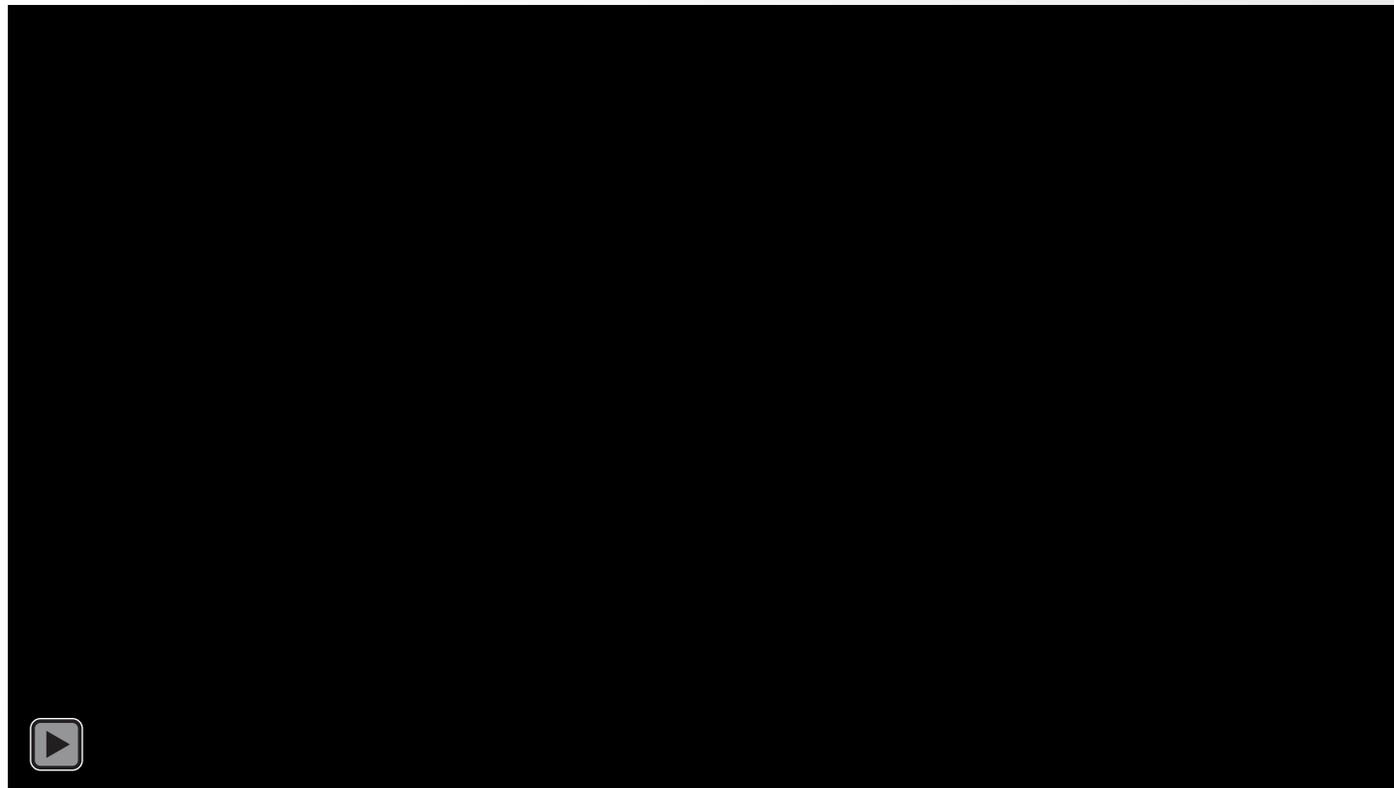

Important parameters for Orbital analyzer

Isotope ratio analysis

- Resolution:
 - Orbitrap analyzes a specific number of ions (ion package) per scan
 - Every scan results in a mass spectrum
 - Higher resolution requires longer scan time:

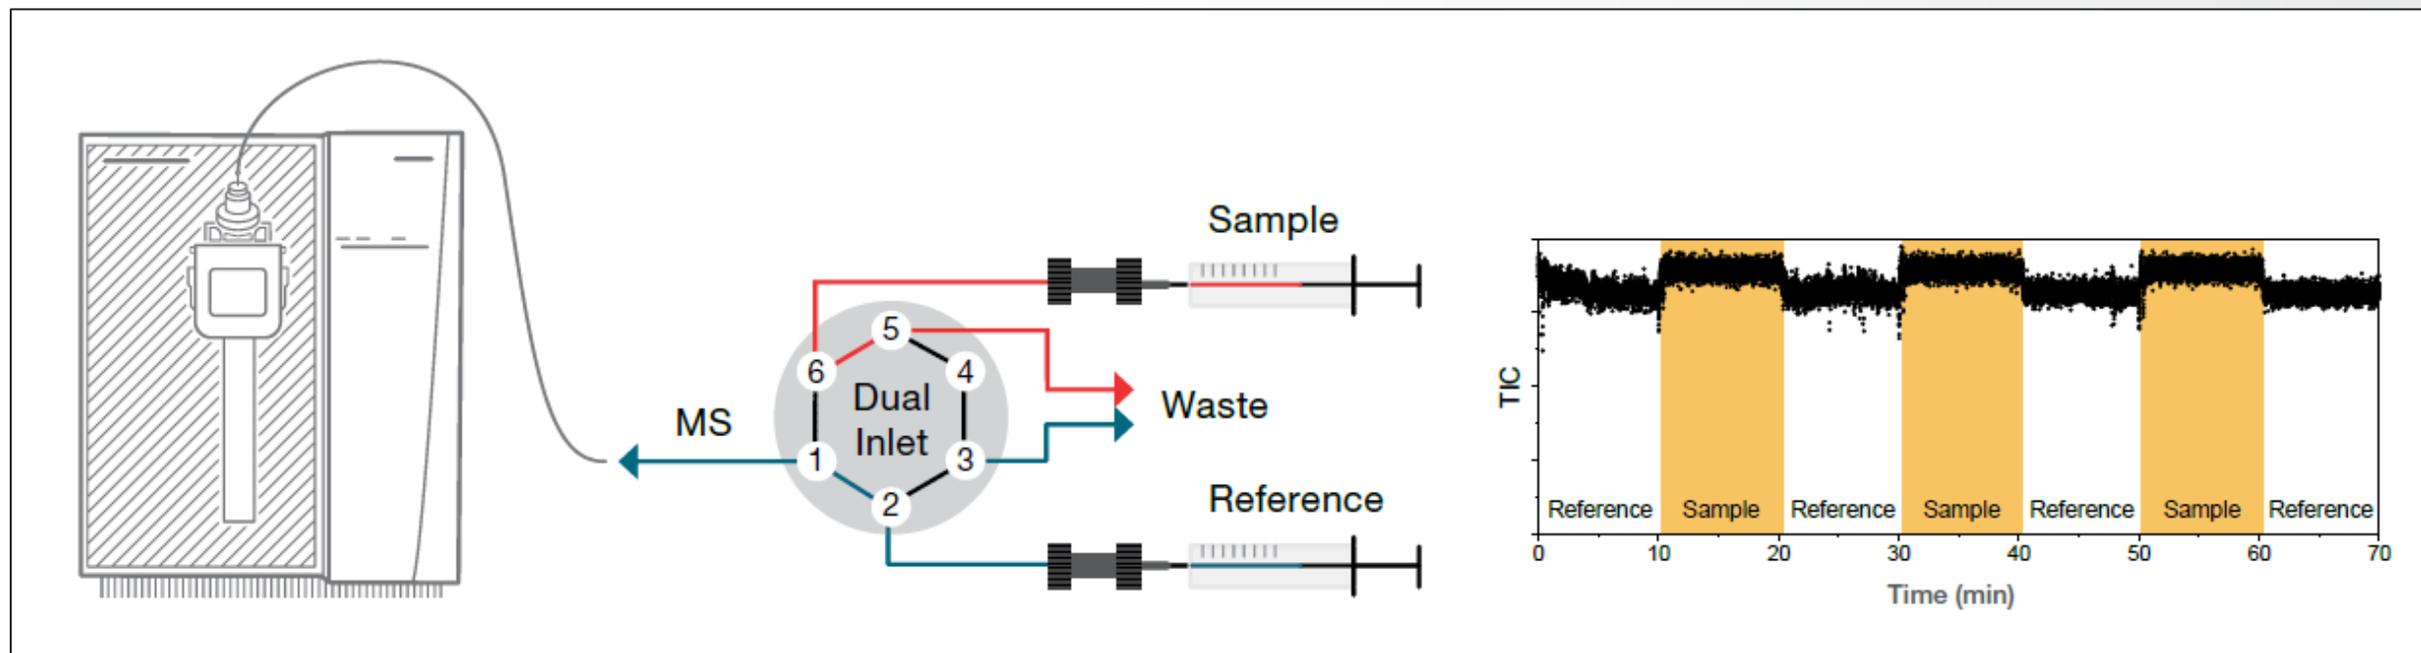

| | Resolution at m/z 200 | Scans per second |
|------------------|----------------------------|---------------------|
| NO_3^- | 15,000 | 22 |
| | 30,000 | 12 |
| HSO_4^- | 45,000 | 10 |
| | 60,000 | 7 |
| Organics | 120,000 | 3 |
| | 240,000 | 1.5 |

Dual Syringe Inlet

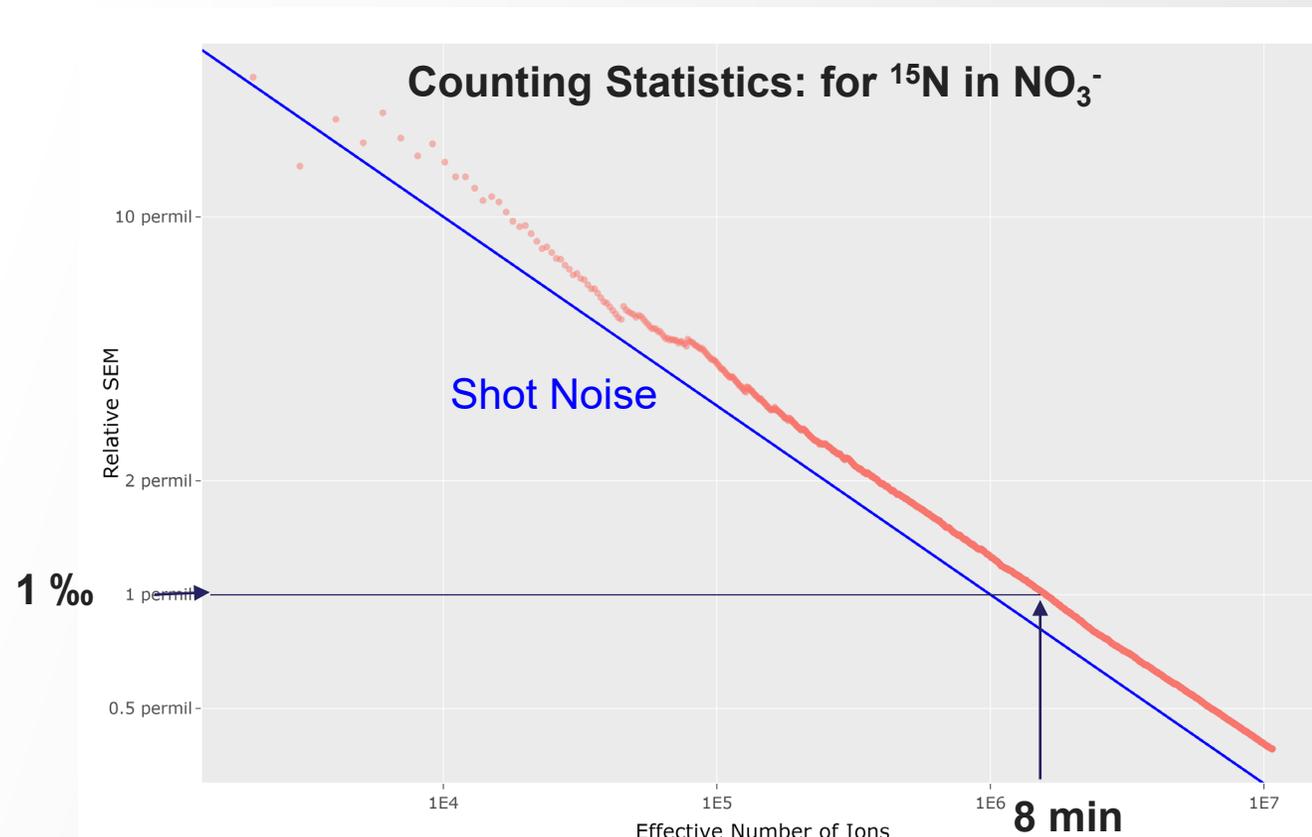

Sample introduction technique

- **Dual Syringe Inlet System** utilizing the diverter valve option of the Orbitrap Exploris MS
- Direct infusion of sample (**50 μM** in MeOH) with a flow rate of **4 $\mu\text{l}/\text{min}$** via a syringe pump; sample reference comparison by switching of a diverter valve.

Isotope ratio methodology for Orbitrap MS

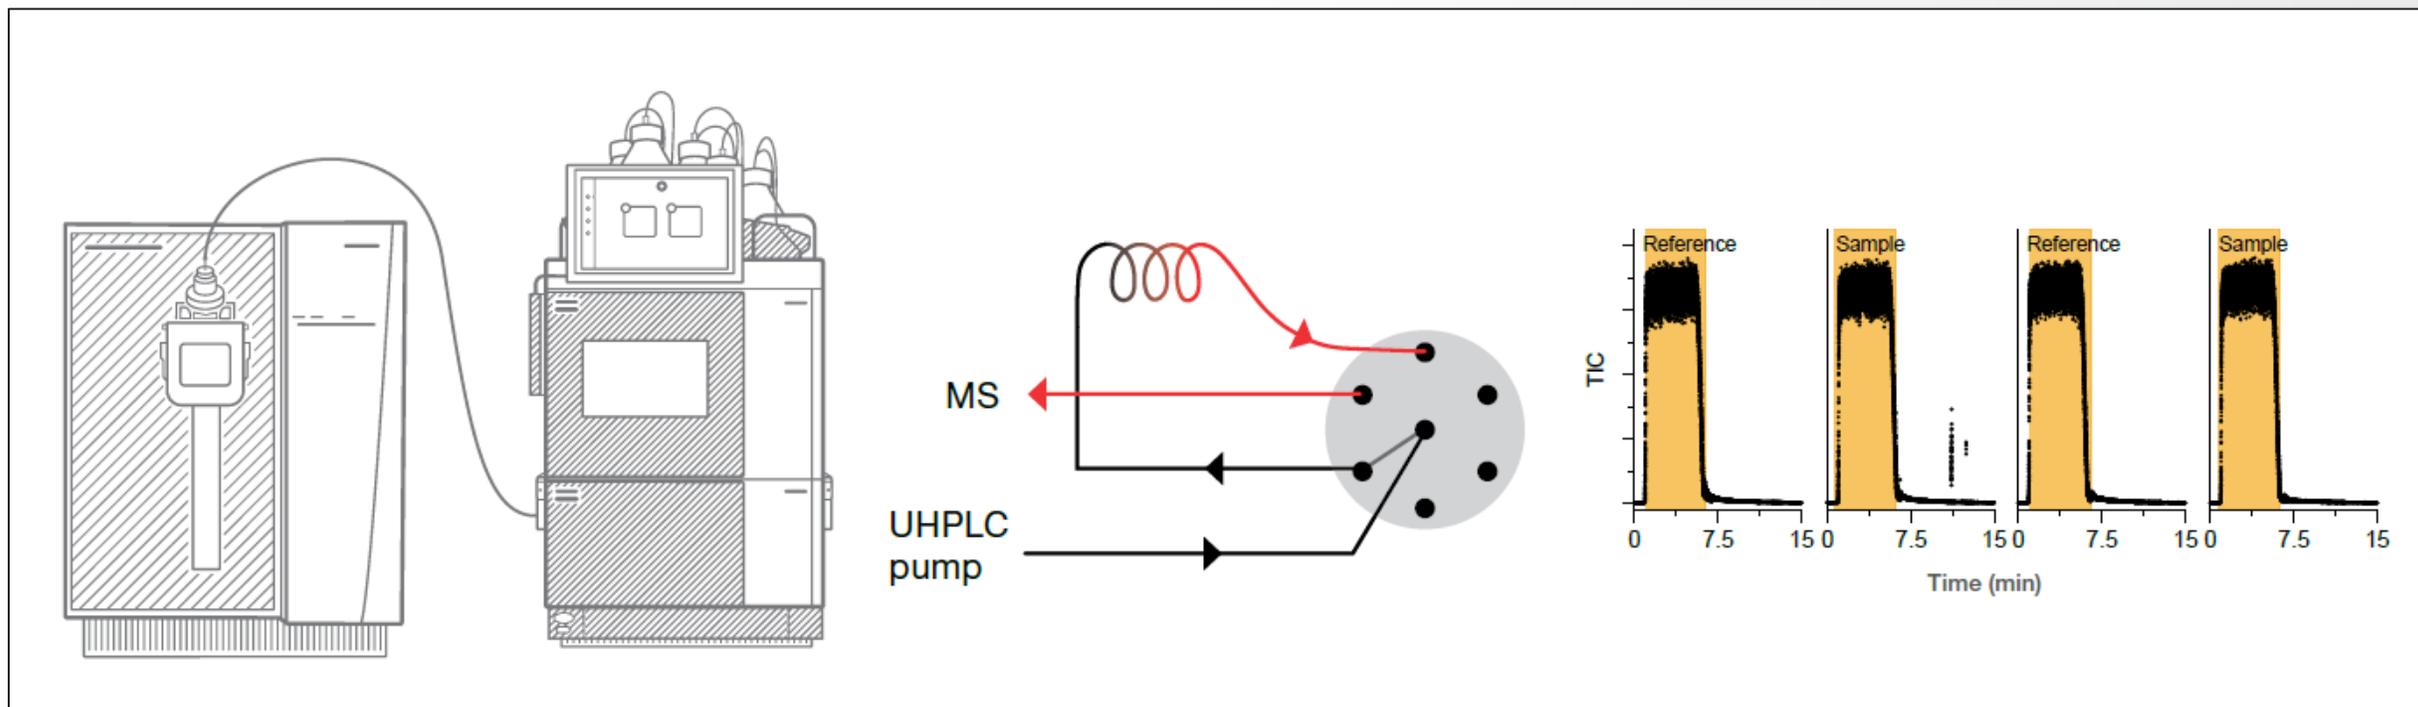

- **Precision: maximizing ion counts**
 - Longer analysis times achieve greater precision.
 - Lower resolution setting requires less time for scanning.
 - Optimize mass range maximize the number of target ions.
- **Accuracy: Sample/Standard comparison**
 - NO_3^- Analysis of signals (reference/sample) for 6–9 mins

Automated In-Flow Injection

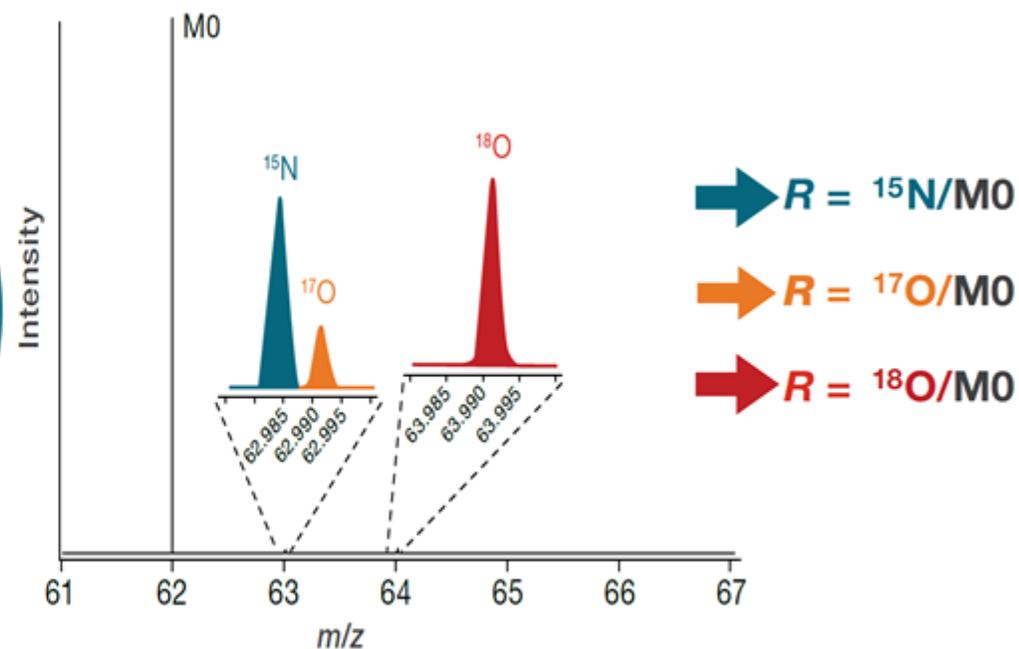

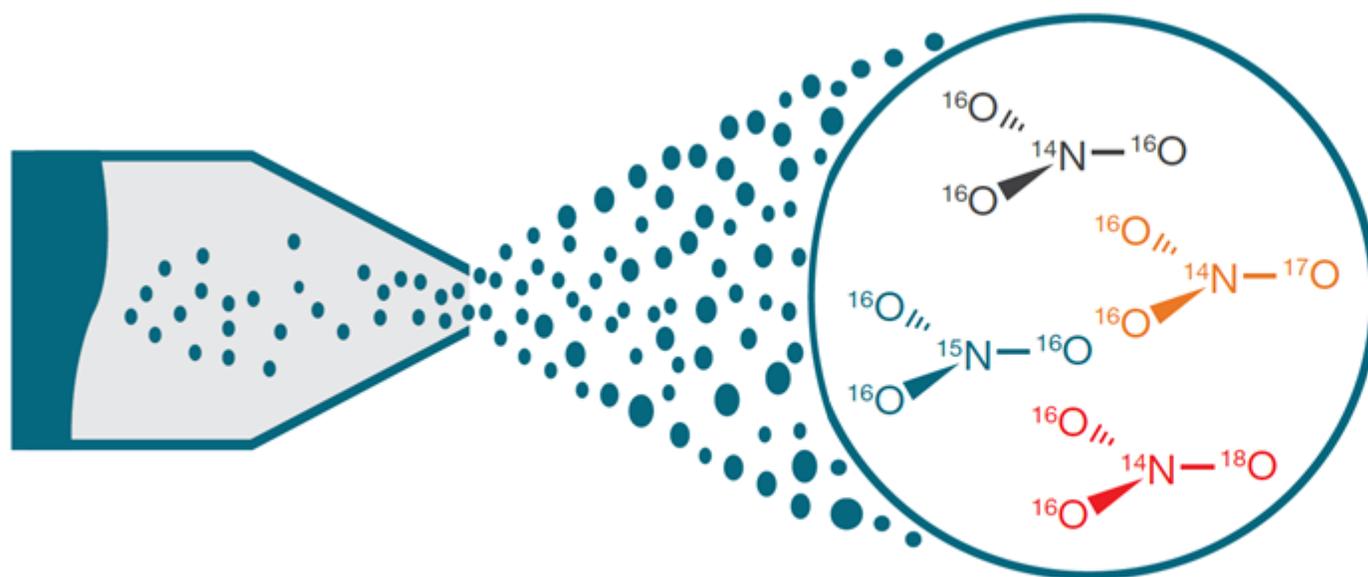

Sample introduction technique

- **In-flow Injection** - Vanquish Neo UHPLC System
- Loop-injection of **20-30 μL** sample (**50 μM** in MeOH) by the Autosampler into a flow of **4 $\mu\text{L}/\text{min}$** of MeOH.

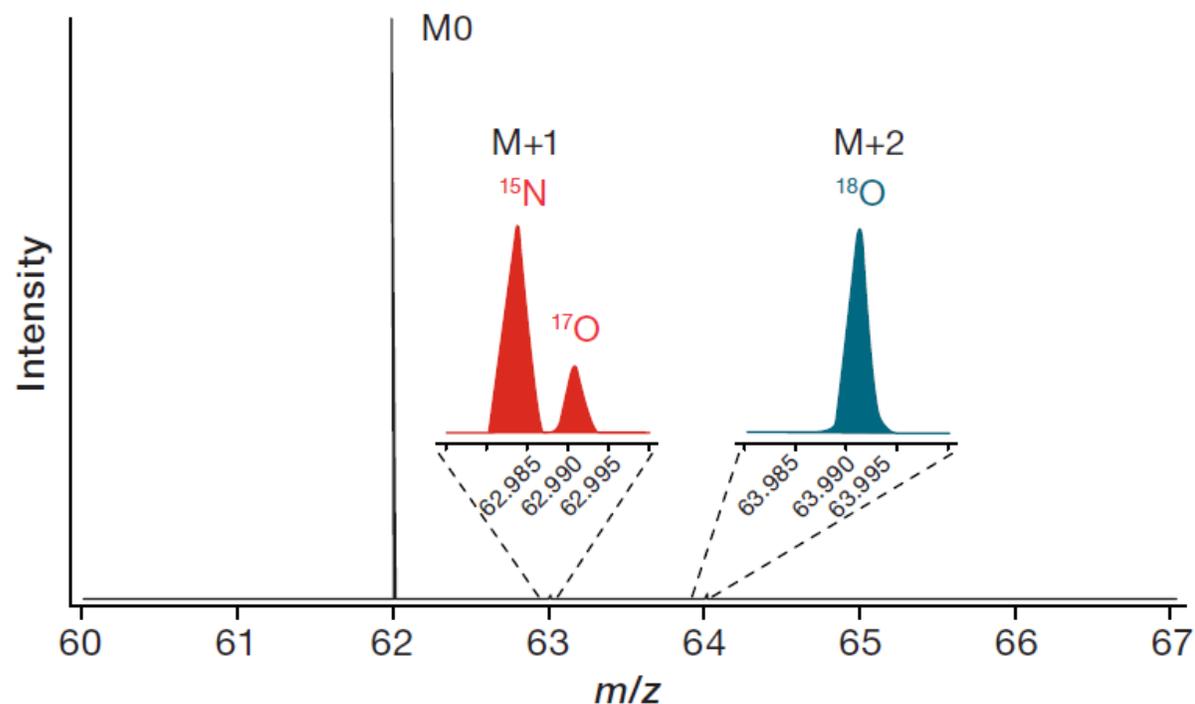

Orbitrap for isotopes: workflow for nitrate

Nitrate simplest model (4 atoms with isotope species: ^{14}N , ^{15}N , ^{16}O , ^{17}O , ^{18}O)

ESI-Orbitrap for isotopes – methodology

'M0' experiment

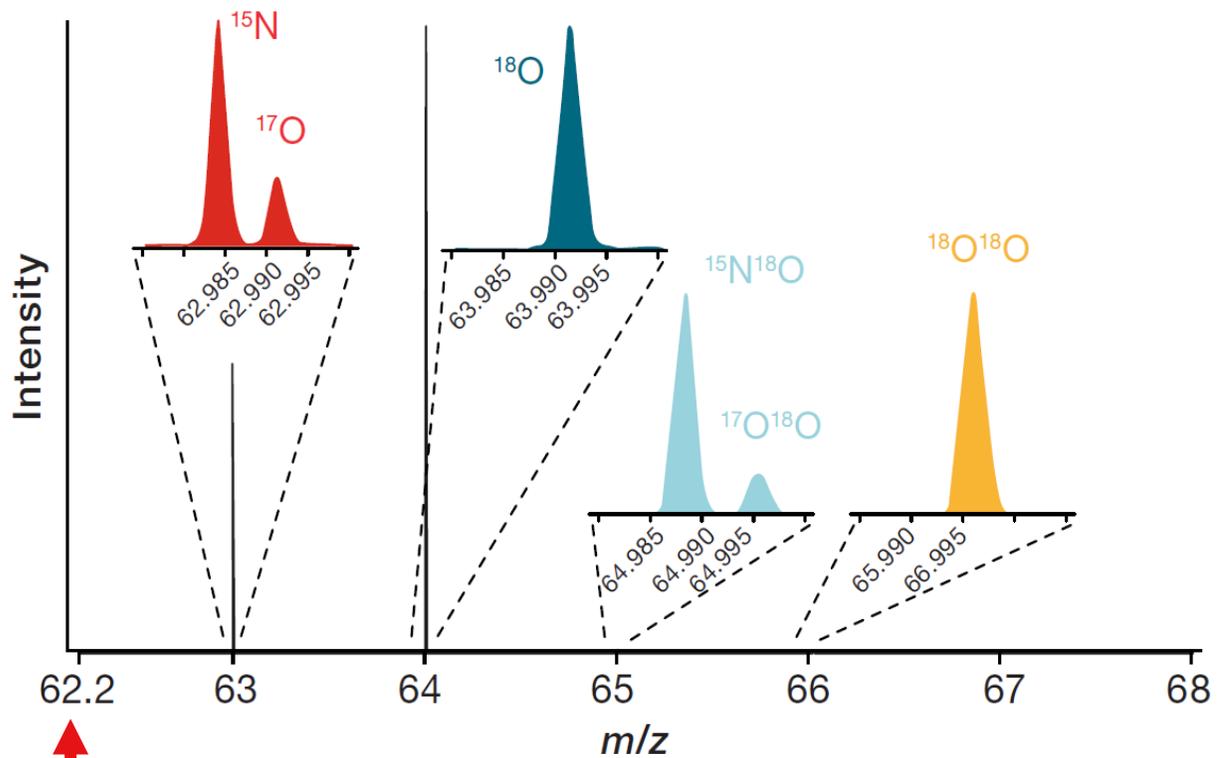

- M0 peak as basepeak

| | <i>m/z</i> | Isotopologue | Abundance | Percentage |
|------------|----------------|--|---------------|-------------|
| M0 | 61.9884 | $^{14}\text{N}^{16}\text{O}_3$ | 989242 | 98.9 |
| M+1 | 62.9854 | $^{15}\text{N}^{16}\text{O}_3$ | 3637 | 0.36 |
| | 62.9926 | $^{14}\text{N}^{17}\text{O}^{16}\text{O}_2$ | 1127 | 0.11 |

Nitrate analysis of environmental samples

'M0' experiment

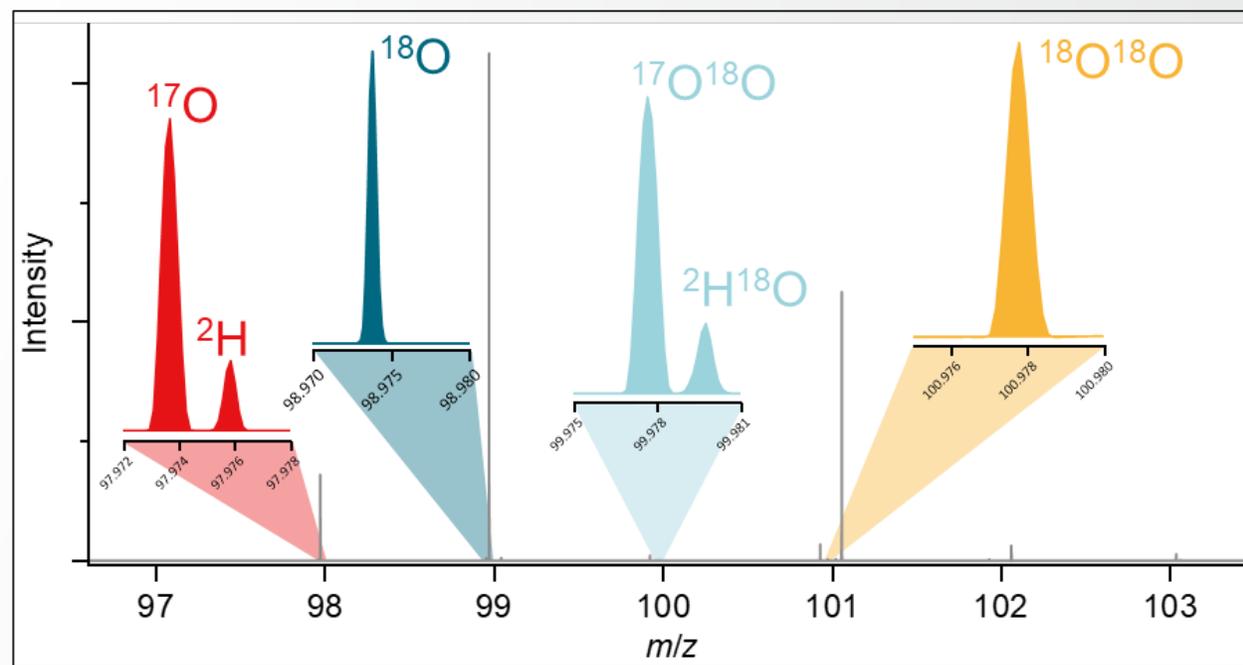

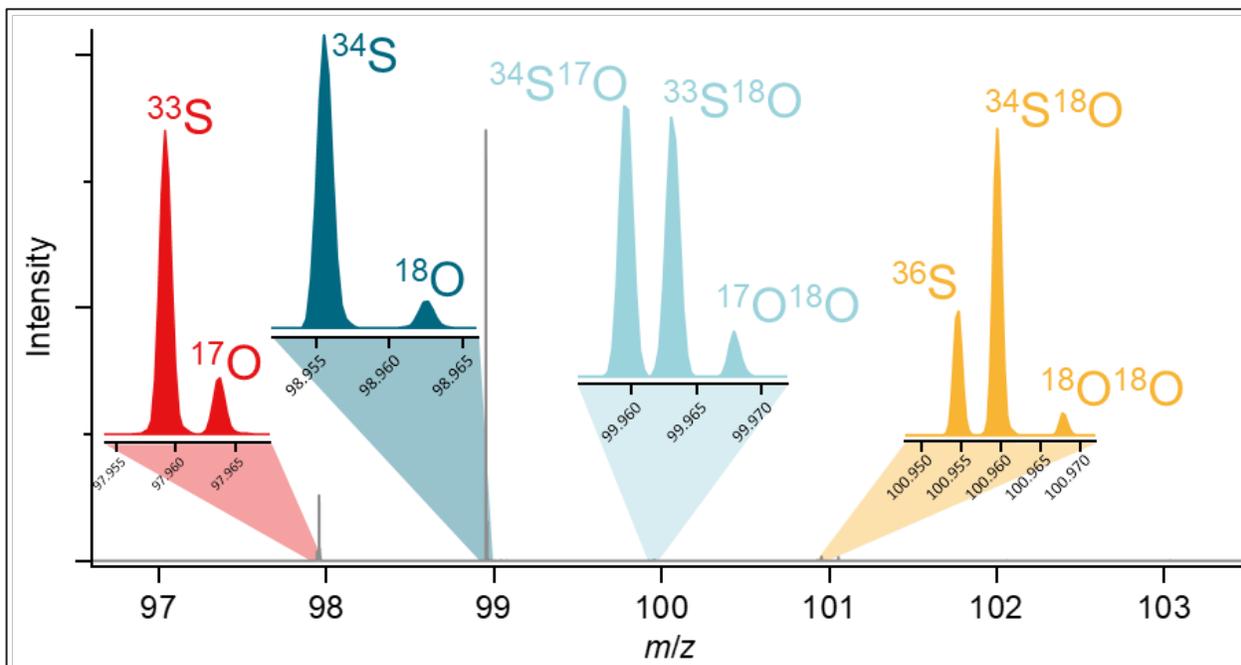

Dual Syringe Inlet methodology

- Sample prep: “Dilute and Shoot”
 - Dilution to **1 μM (62 pg NO₃⁻/μL)** for high salinity samples
- Results δ¹⁵N and δ¹⁸O
 - Precision: < 1‰
 - Difference Orbitrap – Expected: < 1‰
- Takeaway
 - ESI tolerates up to **100-fold Cl⁻** load
 - Ground waters diluted up to **1/500**

Other oxyanions – sulfate and phosphate

Sulfate ionized as HSO_4^-

Phosphate ionized as H_2PO_4^-

Stable Isotope Analysis of Intact Oxyanions Using Electrospray Quadrupole-Orbitrap Mass Spectrometry

First results of methanesulfonic acid (MSA)

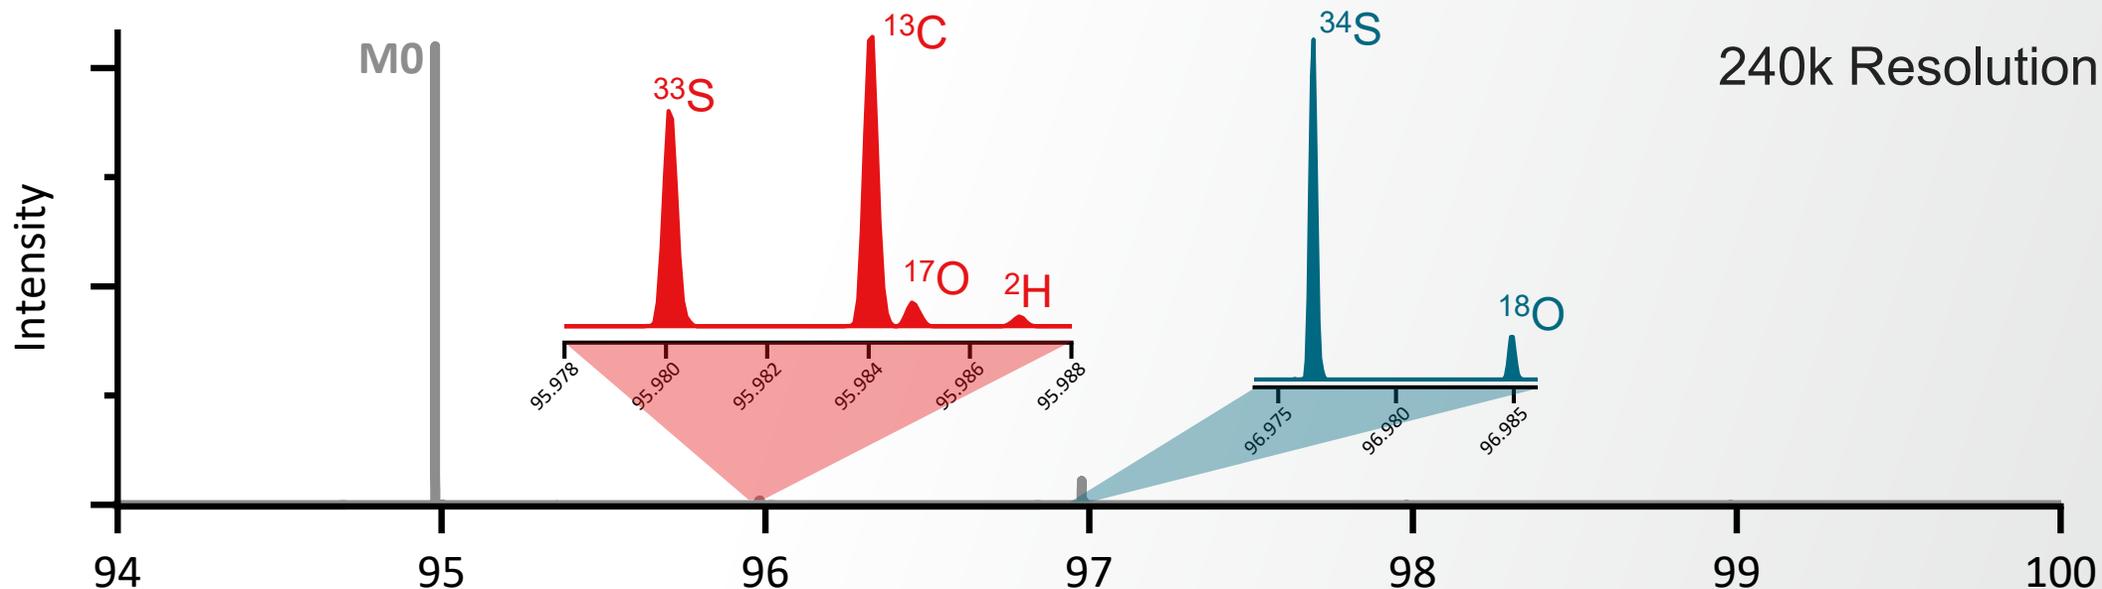

240k Resolution

Fragmentation of methanesulfonic acid (MSA)

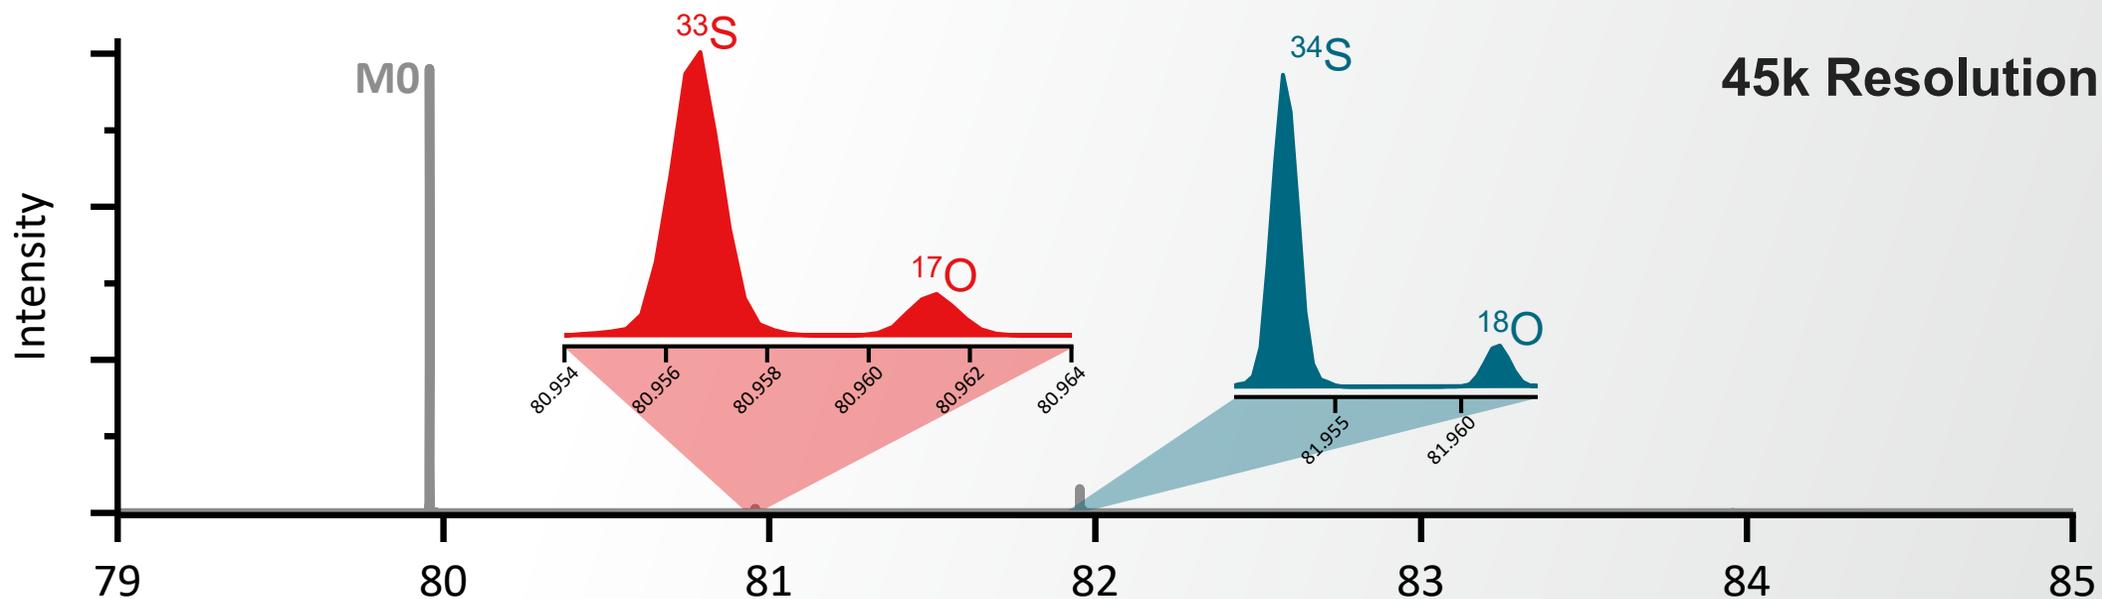

240k Resolution

~ 1 scan/s

45k Resolution

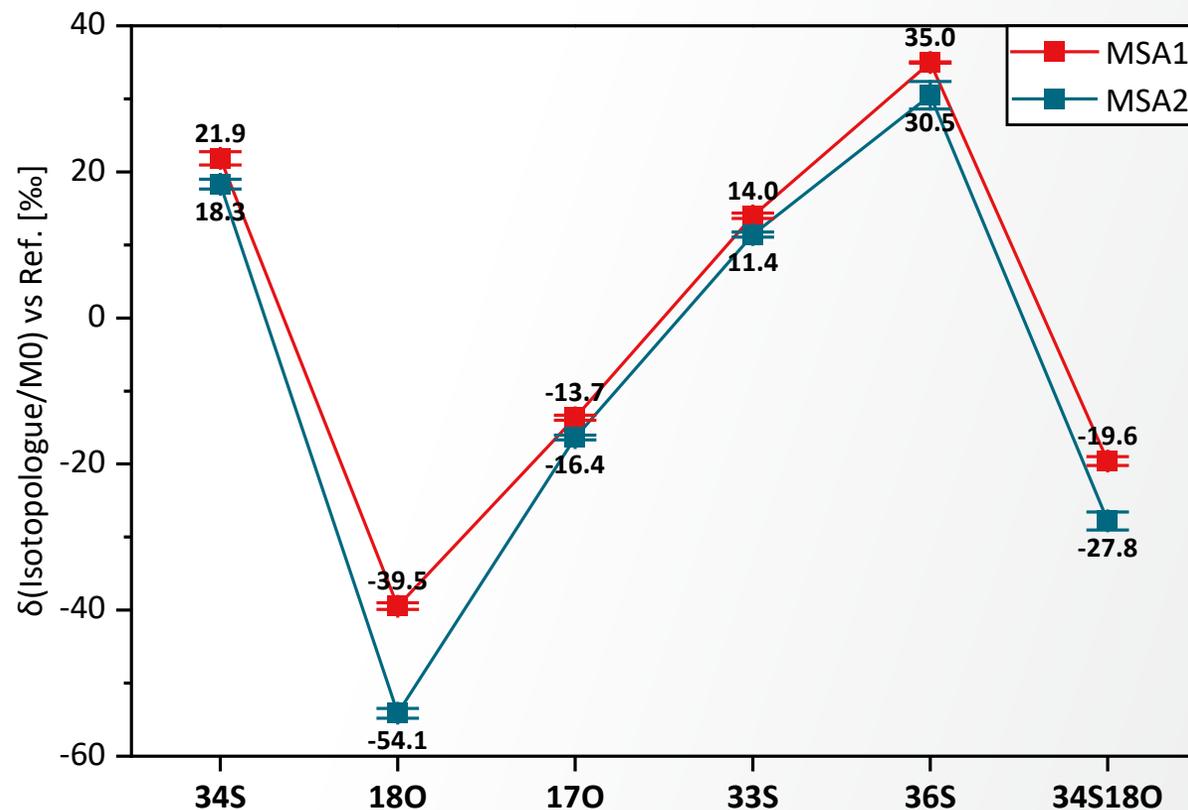

~ 10 scan/s

Analysis of two MSA samples

‘noM0’ experiments:

- **Dual Inlet analysis** of two MSA samples vs a working standard (Sigma-Aldrich)
 - 3x70 min runs → error bars - st. dev. of the 3 runs

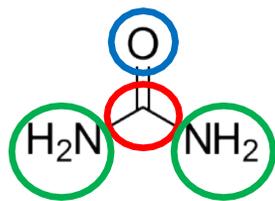

Samples provided by Shohei Hattori
Tokyo Tech & Nanjing

Preliminary results - unpublished data

Outlook: isotopic anatomy of organic compounds

- Examples: amino acids, urea
- Position specific isotope analysis by fragmentation of organic molecules

Urea

$^{13}\text{C} \pm 0.5 \text{ ‰}$

$^{15}\text{N} \pm 0.5 \text{ ‰}$ (no MO)

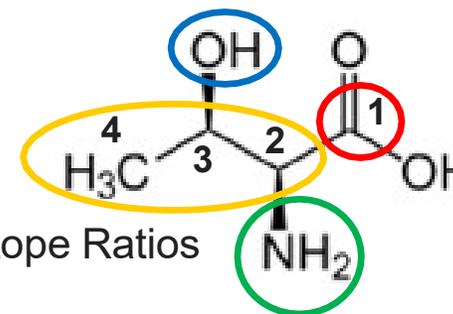

$^2\text{H} \pm 1.5 \text{ ‰}$ (no MO)

$^{18}\text{O} \pm 0.8 \text{ ‰}$ (no MO)

Dual Syringe Inlet Experiment

- Concentration: 50 pmol/ μL
- Resolution: 15000

Threonine

- Compound Specific Isotope Ratios

$^{13}\text{C}_{\text{bulk}} \pm 0.6 \text{ ‰}$

$^{15}\text{N} \pm 2 \text{ ‰}$

$^2\text{H}_{\text{bulk}} \pm 3 \text{ ‰}$

$^{18}\text{O}_{\text{bulk}} \pm 1 \text{ ‰}$

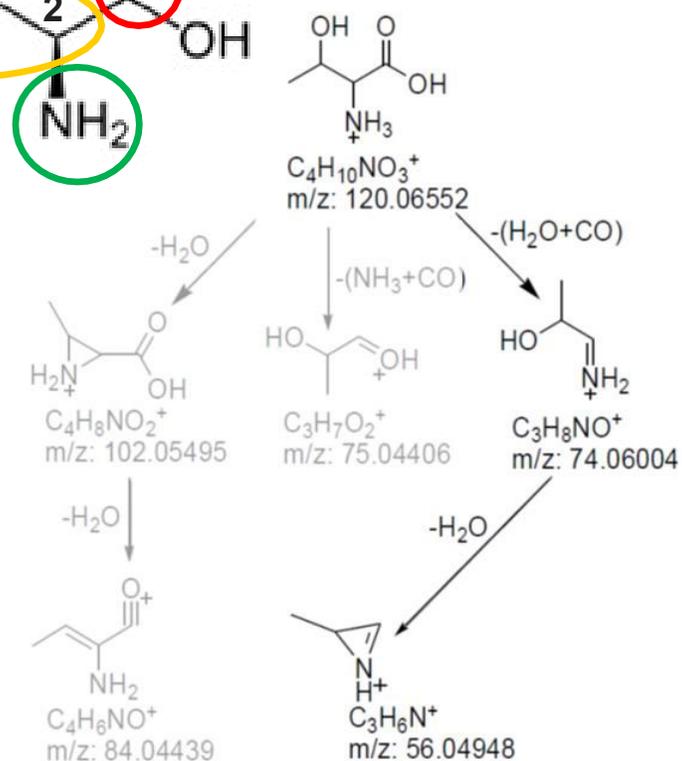

- Position Specific Isotope Ratios

$^{13}\text{C}_{\text{C-1}} \pm 0.9 \text{ ‰}$

$^{13}\text{C}_{\text{C-2,3,4}} \pm 0.6 \text{ ‰}$

$^{18}\text{O}_{\beta\text{-OH}} \pm 2.5 \text{ ‰}$

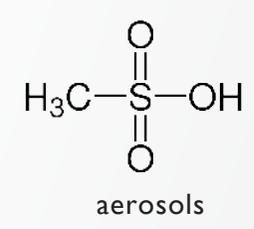

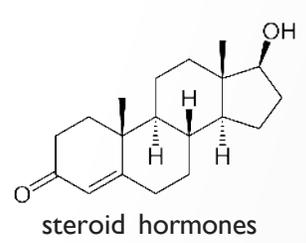

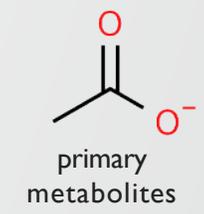

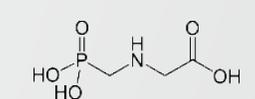

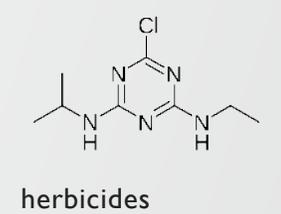

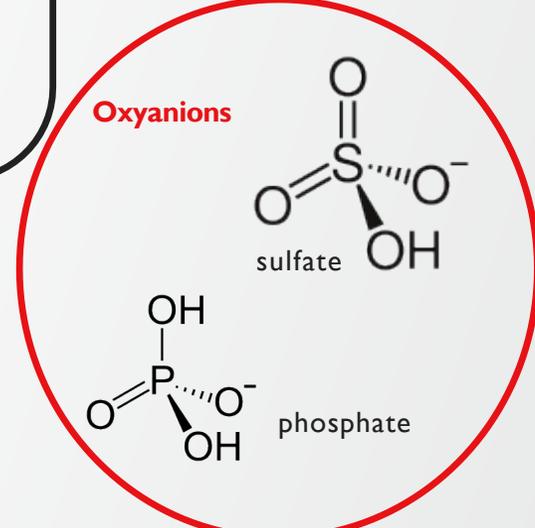

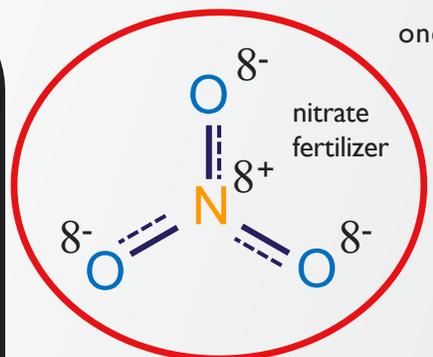

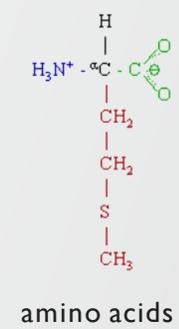

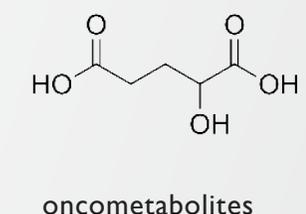

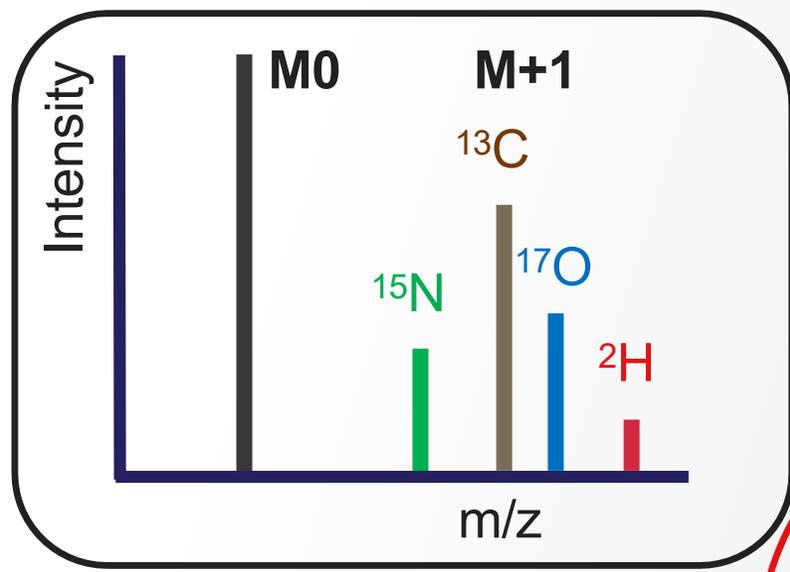

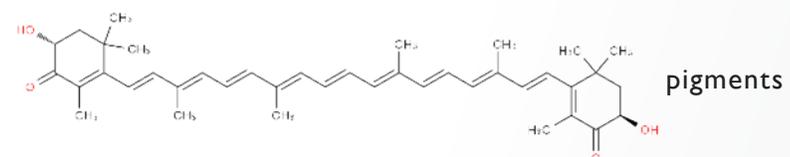

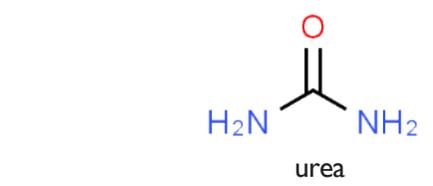

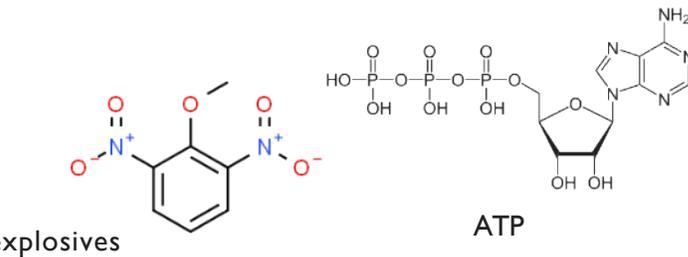

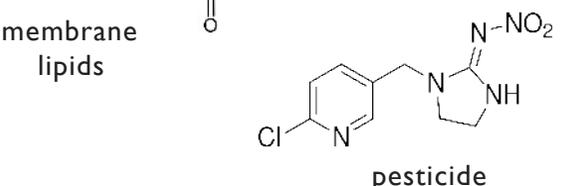

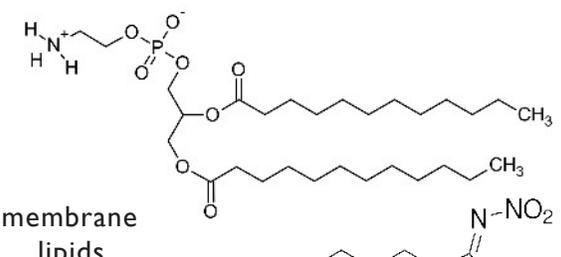

$^2\text{H}_{\text{C}_3\text{H}_6\text{N}} \pm 3 \text{ ‰}$

Fragmentation according Zhang et al, 2019

Basic characteristics for Orbitrap IRMS

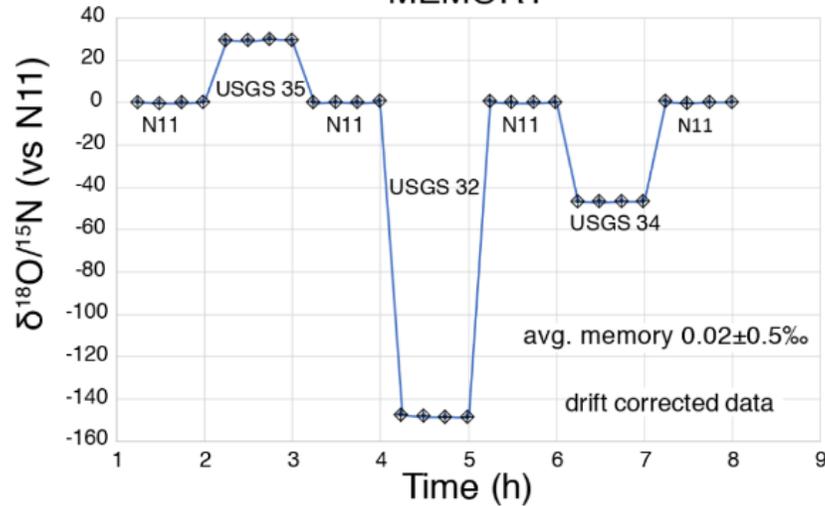

CONCENTRATION

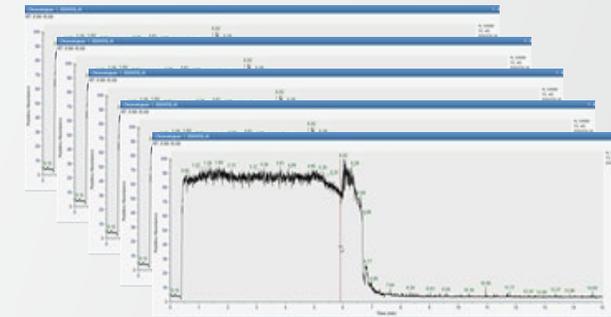

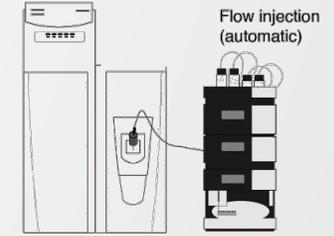

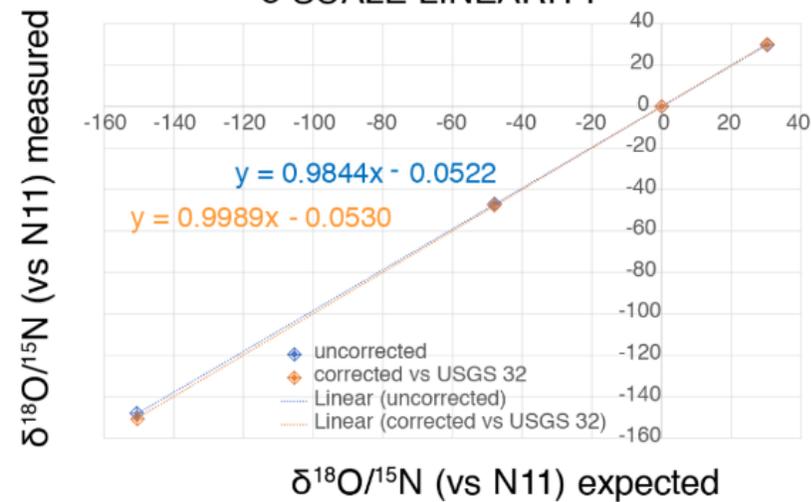

SYSTEM DRIFT

MEMORY

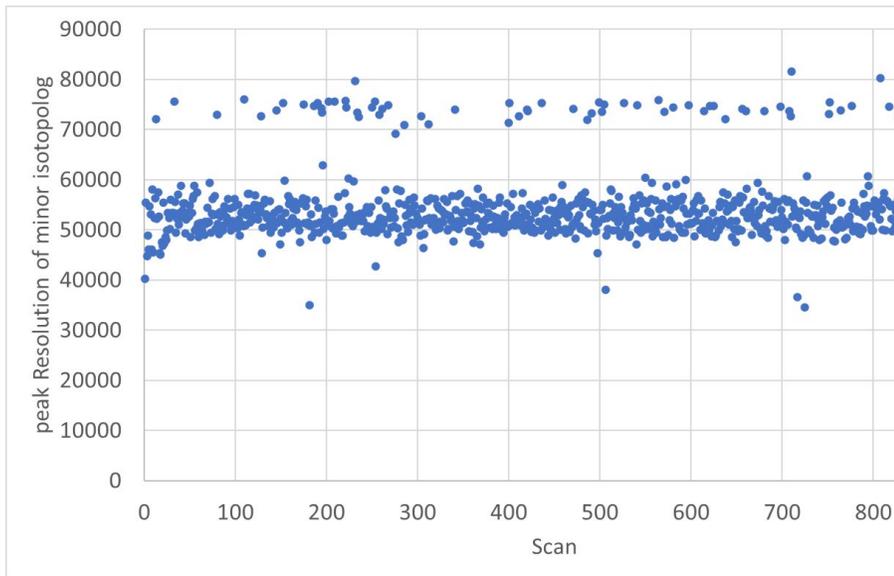

delta SCALE LINEARITY

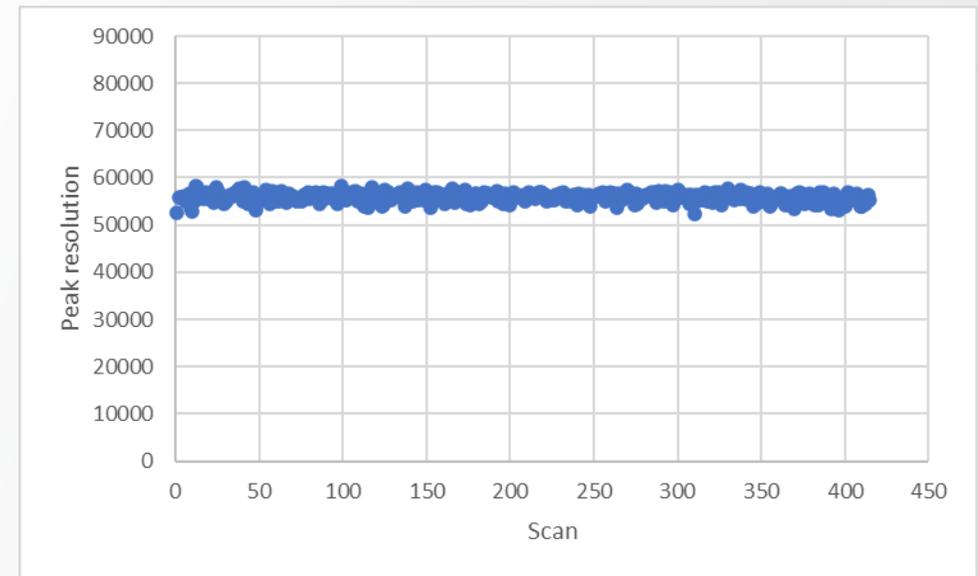

- Intensity of very low abundant isotope species being affected by eFT not being triggered consistently (absorption and magnitude mode)
 - Increase of μ Scans
 - Use of magnitude mode only (turn off eFT)
 - PhiSDM?

34S18O clumped isotopolog at 5 μ scans

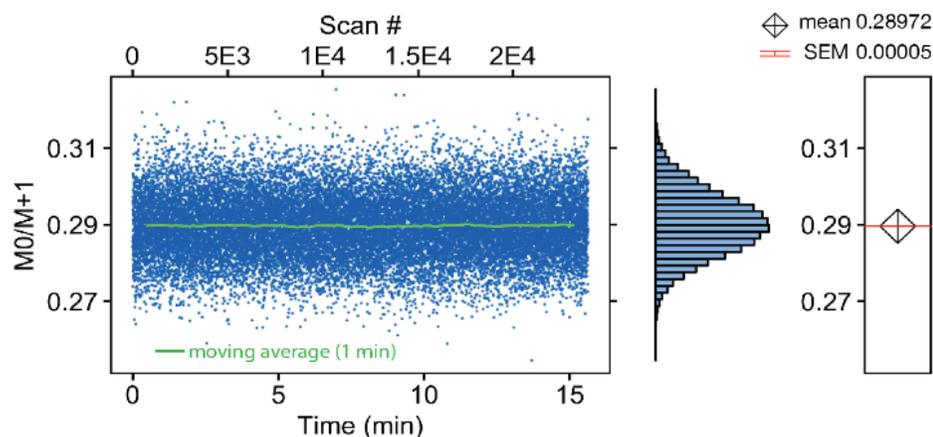

34S18O clumped isotopolog at 10 μ scans

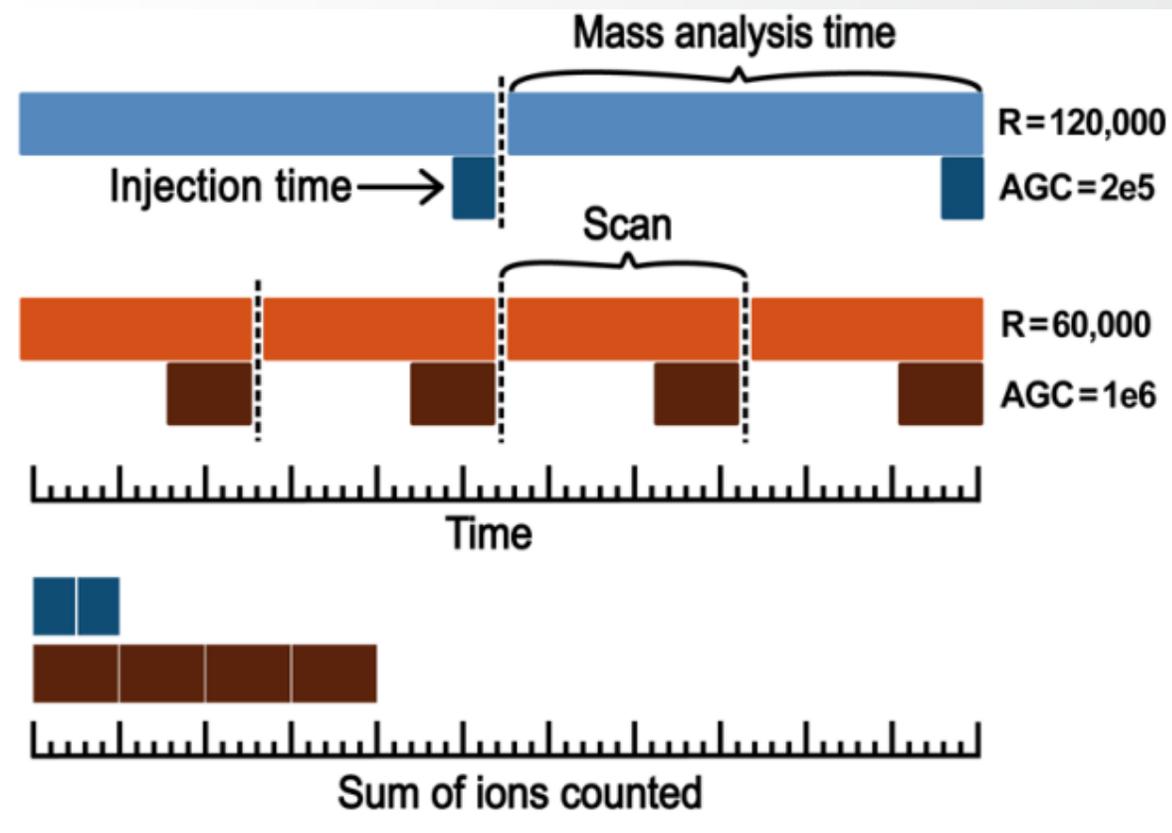

How to increase precision for Orbitrap IRMS

- Ion statistics:

- **15,000 Resolution requires 40 ms / scan**
- **24 Scans per second**

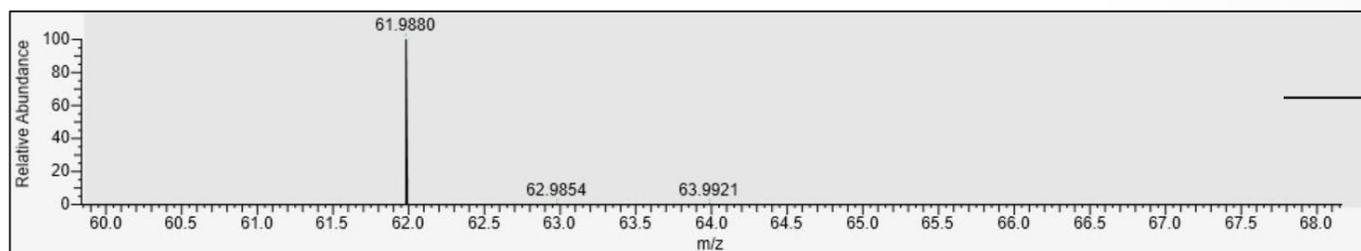

[1] <https://doi.org/10.1021/acs.analchem.1c04141> Anal. Chem. 2022, 94, 1092–1100
 [2] <https://doi.org/10.1016/j.jasms.2009.03.024> J Am Soc Mass Spectrom 2009, 20, 8, 1486–1495

Determining ion counts from Orbitrap measurements

$$(1) \quad R(^{15}\text{N}) = \frac{N(^{15}\text{N}^{16}\text{O}_4)}{N(^{14}\text{N}^{16}\text{O}_4)}$$

- Calculating the ion count (N) for every isotopolog in each scan based on its Orbitrap signal

Ion counts

$$(4) \quad N = \left(\frac{S}{N_P} \right) \left(\frac{C_N}{z} \right) \sqrt{\frac{R_N}{R}}$$

N = Ion counts
 C_N = Empirical factor
 S/N_P = Signal-to-noise ratio
 z = charge of the ion
 R = Orbitrap resolution
 R_N = Reference resolution (240,000)

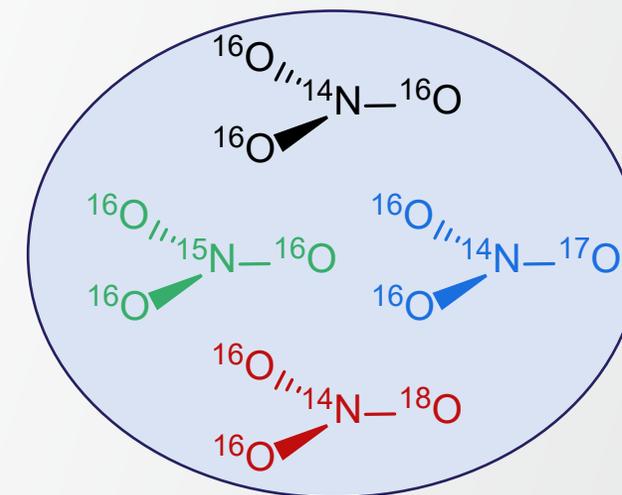

[1] <https://doi.org/10.1021/acs.analchem.1c04141> Anal. Chem. 2022, 94, 1092–1100

[2] <https://doi.org/10.1016/j.jasms.2009.03.024> J Am Soc Mass Spectrom 2009, 20, 8, 1486–1495

Isotope ratios

- Ratio (R) calculated by dividing the ion count (N) of the heavier isotope by the ion count of the lighter isotope
- For ^{15}N in Nitrate:

$$(1) \quad R(^{15}\text{N}) = \frac{N(^{15}\text{N}^{16}\text{O}_3^-)}{N(^{14}\text{N}^{16}\text{O}_3^-)}$$

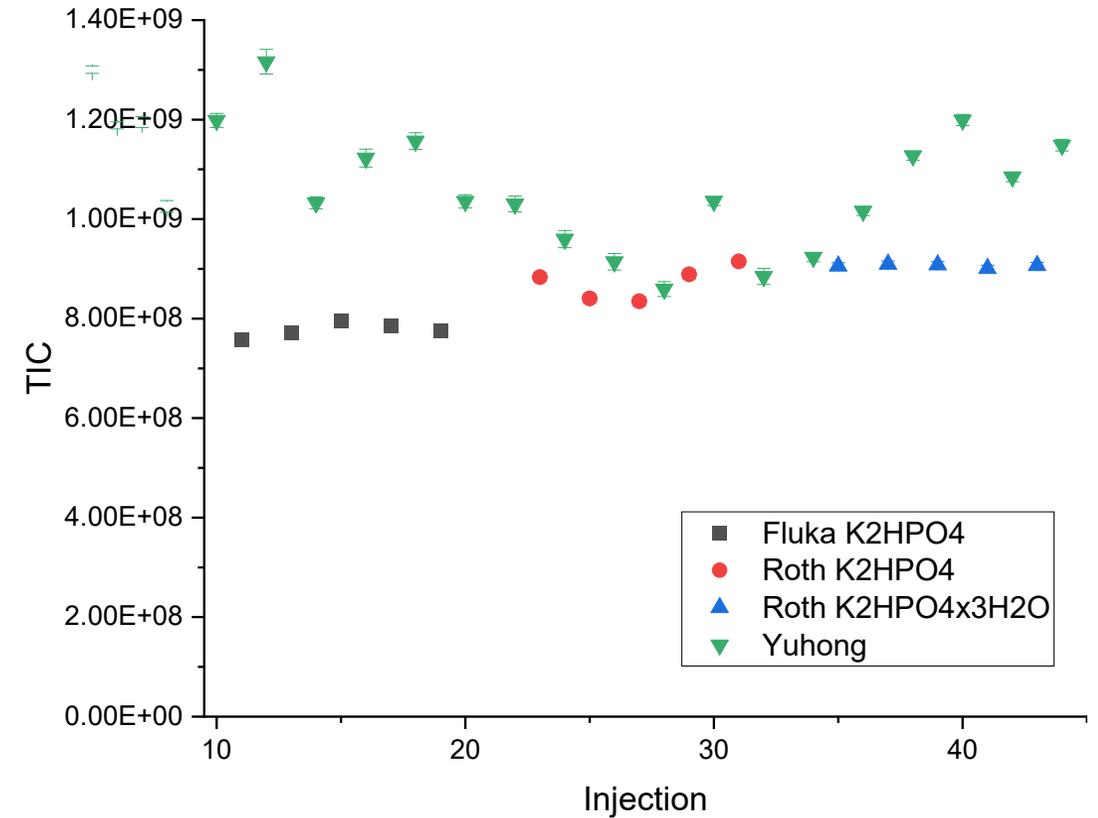

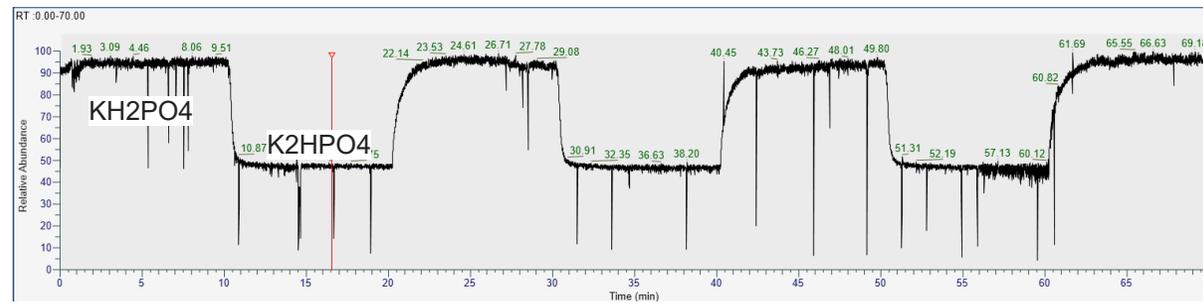

- For the comparison of isotope ratios of natural abundances in between samples a working standards is used
- The difference in the ratios expressed as δ -values

$$(2) \quad \delta(^{15}\text{N}) = \left(\frac{R_{\text{sample}}(^{15}\text{N})}{R_{\text{standard}}(^{15}\text{N})} - 1 \right) \cdot 1000 \text{ [‰]}$$

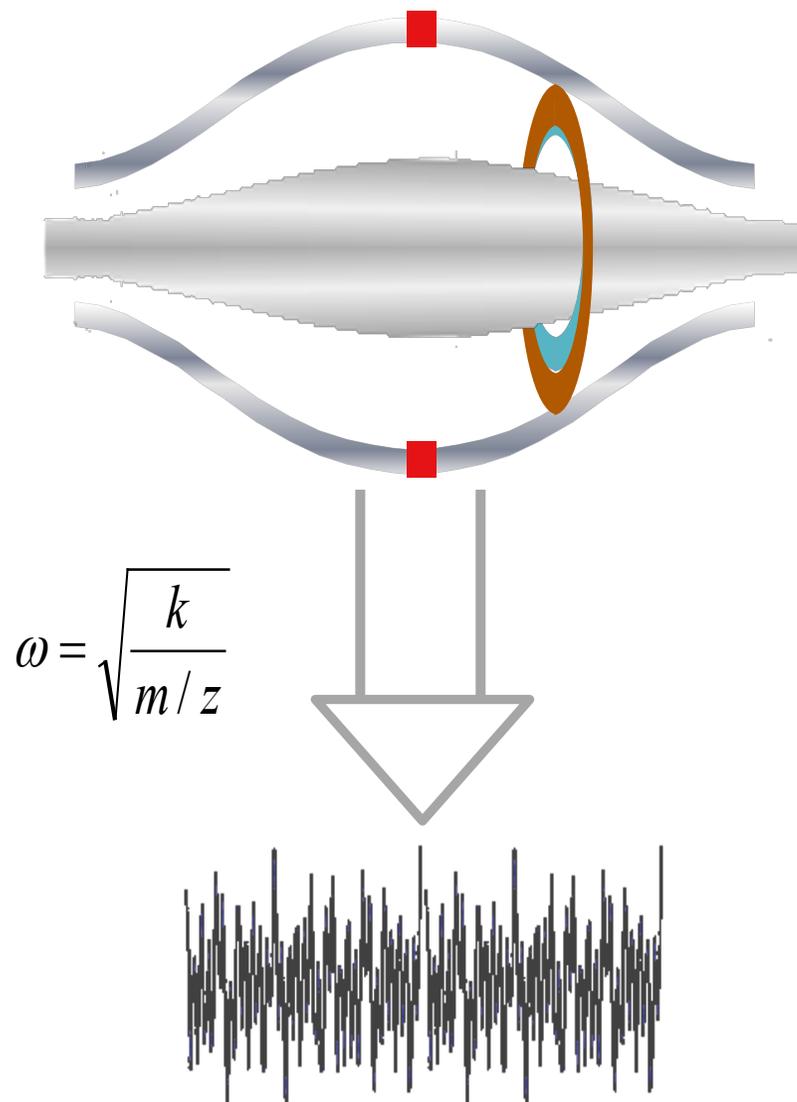

Without pH adjustment:

- KH_2PO_4 : 2.44E9 Intensity
- K_2HPO_4 : 1.16E9 Intensity

K_2HPO_4 gave <50% the intensity of KH_2PO_4

Orbitrap Mass Analyzer

- Ions injected into the Orbitrap are trapped in an electrostatic field
- Each ion oscillates axially with a frequency that is proportional to its mass
- An image current of these oscillations is measured using a split outer electrode
- This image is then converted to a frequency spectrum using Fourier transform
- Frequency spectrum is converted to Mass Spectrum
- The longer a signal (transient) is measured, the higher the resolution
