

# Increasing Pesticide Extraction Efficiency from Wet Samples with Accelerated Solvent Extraction

Aaron Kettle, Sergio Guazzotti, Kannan Srinivasan, and Rahmat Ullah, Thermo Fisher Scientific, Sunnyvale, CA USA

## **OVERVIEW**

Accelerated solvent extraction is a high-temperature, high-pressure extraction technique that is widely used for sample extractions in the environmental, chemical, and food analysis industries. Extractions at higher temperatures and pressures allow faster extraction of analytes relative to conventional solid-liquid based extraction techniques, such as Soxhlet. Typically, the sample is mixed with a dispersant and loaded into a cell followed by extraction with a suitable solvent. Analyte recovery using this method of extraction for wet samples is always challenging, as the presence of water in the sample can interfere with the extraction efficiency. The analyte of interest may partition between the extracting solvent and the water phase. It is, therefore, desirable to dry the sample prior to extraction. Traditional drying techniques, which involve mixing the wet sample with an inorganic salt that has a high affinity for the aqueous phase, are unsuitable for in-cell extraction. This study presents the use of a novel polymer for in-line drying of a wet sample for the analysis of organochlorine pesticides and polyaromatic hydrocarbons (PAHs) in different matrices. Data showing recoveries for each of these target compounds in different matrices will be presented.

#### INTRODUCTION

Thermo Scientific<sup>TM</sup> Dionex<sup>TM</sup> ASE<sup>TM</sup> Prep MAP is a proprietary polymer designed to remove moisture and increase extraction efficiencies from wet samples including soils, tissues, and food products. This unique formulation allows moisture removal under a variety of ionic strength and accelerated solvent extraction conditions. It is useful for in-cell extractions of trace-level organics from a variety of moisture-containing samples such as soil, sediments, animal tissue, fruits, and vegetables with no additional pre- or post- extraction steps.

### MATERIALS AND METHODS

#### **Sample Preparation**

Moisture-containing samples were used or a known amount of water was added to dry samples for Method A. The samples were then combined in a 1:1 ratio of Dionex ASE Prep MAP and Thermo Scientific<sup>TM</sup> Dionex<sup>TM</sup> ASE<sup>TM</sup> Prep DE prior to extraction. Oyster samples for Method B were prepared by blending or chopping to produce a uniform homogenate. A 2 g portion of the homogenate was then accurately weighed and mixed with 1 g of Dionex ASE Prep DE and 1 g Dionex ASE Prep MAP. In both cases, samples were transferred into extraction cells and extractions were performed according to the conditions listed in Table 1, below. In the case of spiked samples, samples were spiked prior to extraction.

**Table 1. Accelerated Solvent Extraction conditions.** 

	Method A	Method B	
Oven Temperature	100 °C – 150 °C	100 °C	
Pressure	1500 psi	1500 psi	
Oven Heatup Time	5 min	5 min	
Static Time	5 – 10 min	5 min	
Static Cycles	1 – 3		
Rinse Volume	60 %		
Solvent	Hexane or 1:1 Acetone/Dichloromethane Hexane/Acetone (1:1, v/v)		

## **RESULTS**

The moisture removal polymer, by itself, can remove up to 5 g of water per gram of the polymer at room temperature. The addition of Dionex ASE Prep DE, when used in an accelerated solvent extraction cell configuration results in improved removal of water under accelerated solvent extraction conditions. The water-absorbing ability of the polymer increases with decreasing temperature. For example, at 100 °C 4 g of Dionex ASE Prep MAP and 4 g of Dionex ASE Prep DE can remove roughly 10 g of water where as at room temperature about 2 g of the polymer is adequate for this application.

## MOISTURE REMOVAL FORMATS

## In-Cell Moisture Removal Mode

This mode is designed for inline moisture removal with the Thermo Scientific<sup>TM</sup> Dionex<sup>TM</sup> ASE<sup>TM</sup> 350 Accelerated Solvent Extractor system. The moisture-absorbing polymer is combined with the Dionex ASE Prep DE, preferably in a 1: 1 ratio, to aid moisture removal. In this mode after the extraction is complete, the collected solvent is expected to be free of moisture. The amount of Dionex ASE Prep MAP required can be estimated from the expected moisture content of the sample. Typically this mode is recommended for all samples where the extraction method is run at 125 °C and below. The benefit of this mode is that there is no need to remove the moisture post extraction.

## In-Vial Moisture Removal Mode

This mode is designed for offline moisture removal such as with the collected solvent extract from the accelerated solvent extraction. The amount of polymer required can be calculated based on the estimated amount of moisture in the extract container. The amount of moisture-absorbing polymer needed is 0.20 ± 0.05 g for absorbing one gram of water at room temperature. The extract can also dried by passing it through a bed of Dionex ASE Prep MAP placed on a filter paper. This mode is applicable to all accelerated solvent extraction methods independent of temperature.

# **Combination Mode**

In this mode, the in-cell moisture removal is followed by in-vial moisture removal. If some breakthrough of moisture is observed in the extract during extraction, addition of a small amount of polymer in the collection bottle can result in complete moisture removal. This mode is particularly useful for samples with unknown moisture content and for extractions occurring above 125 °C. The mode is also recommended for use with water-containing solvents.

# In-Cell Moisture Removal (Method A)

A combination of Dionex ASE Prep MAP and Dionex ASE Prep DE (1:1) was used to perform in-cell extractions on wet samples at various extraction temperatures and cell sizes, using hexane as the extraction solvent. Table 2 shows the results of this analysis. The water removal efficiency drops as the temperature increases.

Table 2. In-cell moisture removal using Dionex ASE Prep MAP and Dionex ASE Prep DE at various temperatures and cell sizes during accelerated solvent extraction.

Extraction Temperature °C	Total Water Present in Cell (g)	Dionex ASE Prep MAP (g)	Dionex ASE Prep DE (g)	Cell Size (mL)
100	5.05	2	2	34
125	2.54	2	2	34
150	2.15*	2	2	34
100	10.00	4	4	66
125	5.05	4	4	66
150	2.09*	4	4	66
100	15.10*	6	6	100
125	8.14*	6	6	100
150	2.14*	6	6	100

\*Maximum water removed

Table 3 shows the amount of polymer required for in-cell moisture removal with accelerated solvent extraction at a variety of common temperatures. It is clear that, as the temperature increases, water removal and maximum water removal decreases.

Table 3. Polymer and Dionex ASE Prep DE amounts required for in-cell moisture removal at various temperatures.

Temperature °C	Polymer / g water (g)	Dionex ASE Prep DE / g water (g)
100	0.4	0.4
125	0.8	0.8
150	1.0	1.0

### **Moisture Removal Under High Ionic Strength Conditions**

The moisture removal capacity of the Dionex ASE Prep MAP was measured at room temperature with and without added salt solution (Table 4). The moisture removal capacity was unaffected by the salt concentration. In contrast, the other commercially available polyacrylate-based polymer showed a lower moisture-absorbing ability as the salt concentration increased. Additionally, the polyacrylate-based polymers are not suitable for extraction under accelerated solvent extraction conditions because water is released from the polymer at elevated temperatures. In contrast, the Dionex ASE Prep MAP is ideal for moisture removal under accelerated solvent extraction conditions.

Table 4. Moisture removal capacity of the Dionex ASE Prep MAP compared to a polyacrylic-acid-based polymer.

Type of Polymer	Polymer to absorb 1 g water (g)	Polyer to absorb 1 g of 2.91% NaCl* (g)	Polymer to absorb 1 g of 26.5% NaCl** (g)
Dionex ASE Prep MAP	0.20	0.19	0.18
Commercial polyacrylate-based polymer	0.04	0.08	0.27

The spiked oyster samples were treated either with Dionex ASE Prep MAP and Dionex ASE Prep DE (1:1) or by using sodium sulfate as the drying agent prior to in-cell extraction in the Dionex ASE 350 Accelerated Solvent Extractor. The extraction was pursued at 100 °C using hexane:acetone (1:1) as solvents. The extracts were analyzed by GC-ECD. The results in Table 4 show recoveries ranging from 91% for Lindane to 114% for DDT when the extractions are done using Dionex ASE Prep MAP and Dionex ASE Prep DE. The recoveries for extractions done with sodium sulfate are considerably lower ranging from 69% for DDT to 81% for Lindane. The data shows that Dionex ASE Prep DE is an effective drying agent for wet oyster samples, with excellent recoveries for the six OCPs. In contrast, the sodium-sulfate-treated sample showed poorer recoveries.

Soil samples of 5 g each were spiked with known concentrations of PAHs. Following spiking with PAHs, the soil samples were moistened with a known amount of water (30% moisture). Each of the spiked, wet soil samples were mixed with 4 g of 1:1 polymer and Dionex ASE Prep DE and loaded into a 34 mL cell. The soil samples were then extracted using the Dionex ASE 350 Accelerated Solvent Extractor and Method A. The extracts were evaporated to 1 mL under nitrogen stream at 40 °C. The concentration of the final samples was calculated to be 20 µg/mL. The extracts were analyzed using GC-FID. Table 6 shows that PAH recovery using Dionex ASE Prep MAP in the in-cell and in-vial format shows comparable results, with the exception of Acenaphthylene and Benzo(g,h,i)perylene. This result indicates that the in-cell extraction conditions for these two analytes still need to be optimized; however the recovery values are still within the acceptable range of U.S. EPA Method 8270  $(\pm 30\%).$ 

Table 6. PAH recovery using gas chromatography with flame ionization detection.

# CONCLUSIONS

- Unique formulation of Dionex ASE Prep MAP allows moisture removal under a variety of ionic strength and accelerated solvent extraction conditions.
- Useful for in-cell extraction of organochlorine pesticides in a variety of moisture-containing samples. OCP recoveries in oyster samples range from 91% for Lindane to 114% for DDT when the extractions are done using ASE Prep MAP and ASE Prep DE. The recoveries for extractions done with sodium sulfate are considerably lower, ranging from 69% for DDT to 81% for Lindane.
- Dionex ASE Prep MAP has a high-capacity for water removal and does not suffer from some of the limitations of clumping or precipitation observed in some of the traditional drying methods.
