Oncomine Myeloid Research Assay

One single assay for comprehensive coverage of relevant myeloid mutations

Current analysis of hematological malignancies involves multiple sequential tests and laborious workflows. Adoption of next-generation sequencing (NGS) methods into clinical research laboratories has created an unprecedented opportunity to profile the multiple relevant driver genes in myeloid malignancies.

The Ion Torrent™ Oncomine™ Myeloid Research Assay is a comprehensive, targeted NGS assay designed to assist in the understanding of myeloid cancer. Specifically, it interrogates all relevant DNA mutations and fusion transcripts associated with myeloid disorders in a single NGS run. Our panel comprises 40 key DNA target genes, 29 driver genes, and a broad fusion panel (Table 1) to cover all the major myeloid disorders associated with acute myeloid leukemia (AML), myelodysplastic syndrome (MDS), myeloproliferative neoplasms (MPN), chronic myeloid leukemia (CML), chronic myelomonocytic leukemia (CMML), and juvenile myelomonocytic leukemia (JMML).

“With the Ion Torrent myeloid panel, we could move the testing of all myeloid malignancies to one assay and improve on turnaround time while keeping the cost down. In our assessment of previously characterized samples, we had excellent concordance for relevant variants, including fusions.”

—Nancy Carson, PhD
Head, Division of Genetics, Department of Lab Medicine and Pathology
Saint John Regional Hospital, Canada
Simple and integrated workflow
The assay is compatible with both the Ion PGM™ and Ion S5™ Systems, and comes with either manual or automated library preparation configurations for the Ion Chef™ system (Figure 1). Sample preparation to analysis can be achieved in 2–3 days, depending on the sample type, and is powered by our integrated Oncomine Knowledgebase reporting software (Figure 2), which links variants to relevant labels, guidelines, and global clinical trials.

Sample prep
- Sample type—blood or bone marrow
- Library preparation
  - 2 DNA pools—10 ng of gDNA for each pool
  - 1 RNA pool—10 ng of RNA for 1 RNA pool
- Template preparation (Ion Chef System)

Sequencing
- High-throughput sequencing on Ion S5 Systems or Ion PGM System

Analytics
- Automated reporting with Oncomine Knowledgebase Reporter

Features of the Oncomine Myeloid Research Assay include:
- **Ease of use**—one simple, robust workflow with all mutations encapsulated in 2 DNA and 1 RNA pools
- **Effective designs**—great coverage of challenging targets such as CEBPA and internal tandem duplications of FLT3 (FLT3-ITDs)
- **Flexibility**—validated with blood and bone marrow samples on the Ion PGM and Ion S5 Systems, with manual and automated library preparation
- **Speed**—from samples to answers in <3 days, with up to 4 samples on an Ion 318™ Chip or 12 on an Ion 530™ Chip
