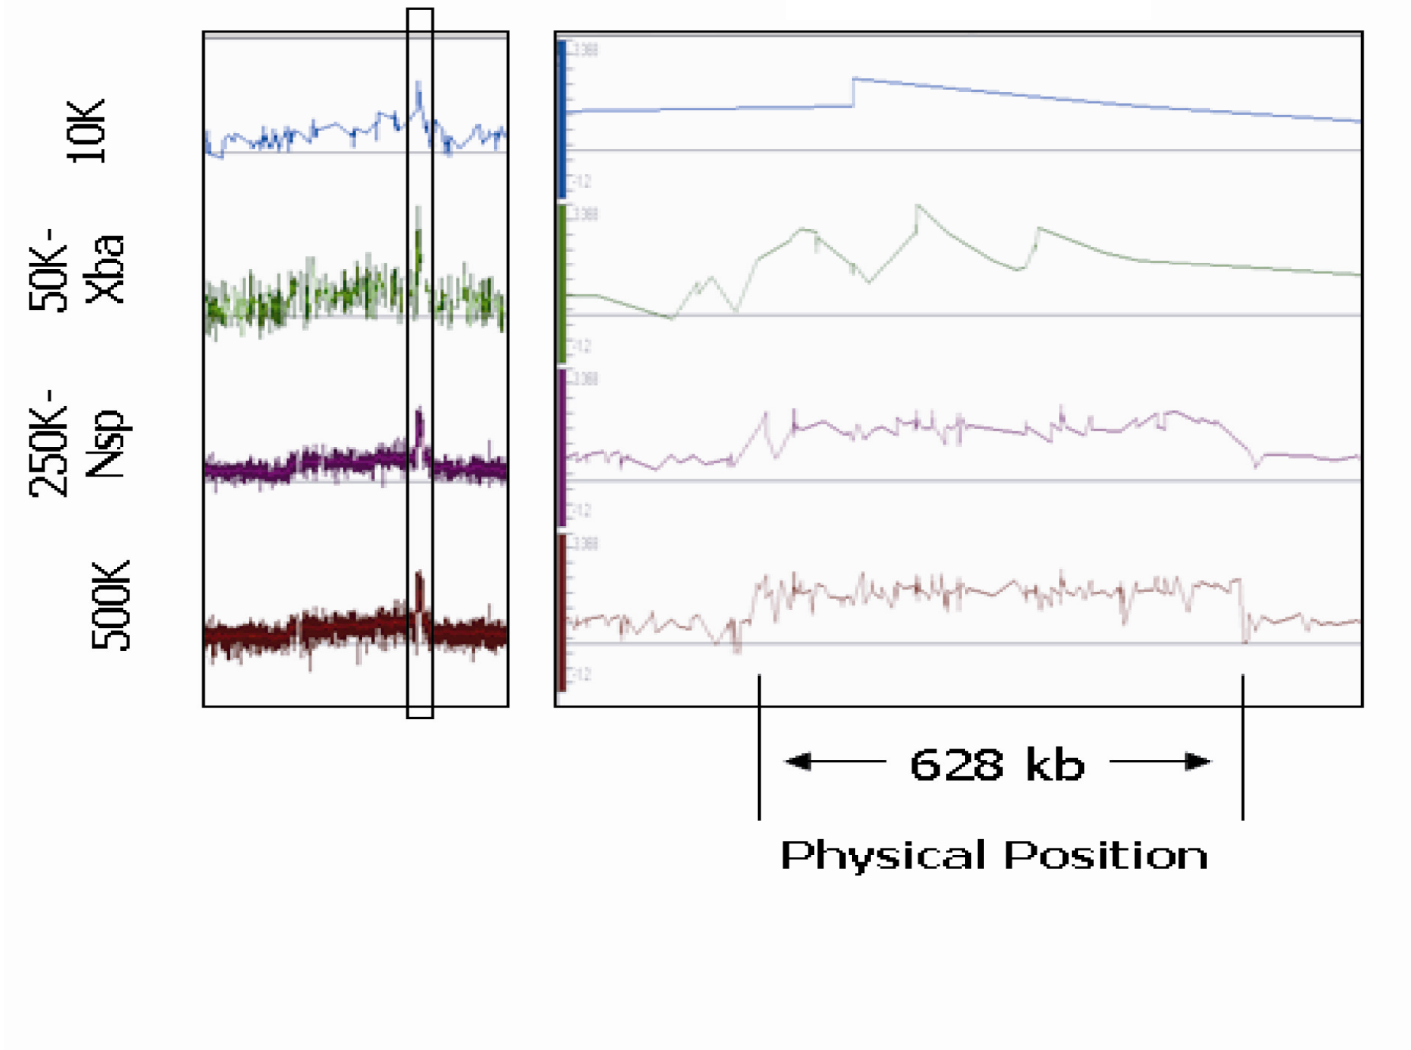
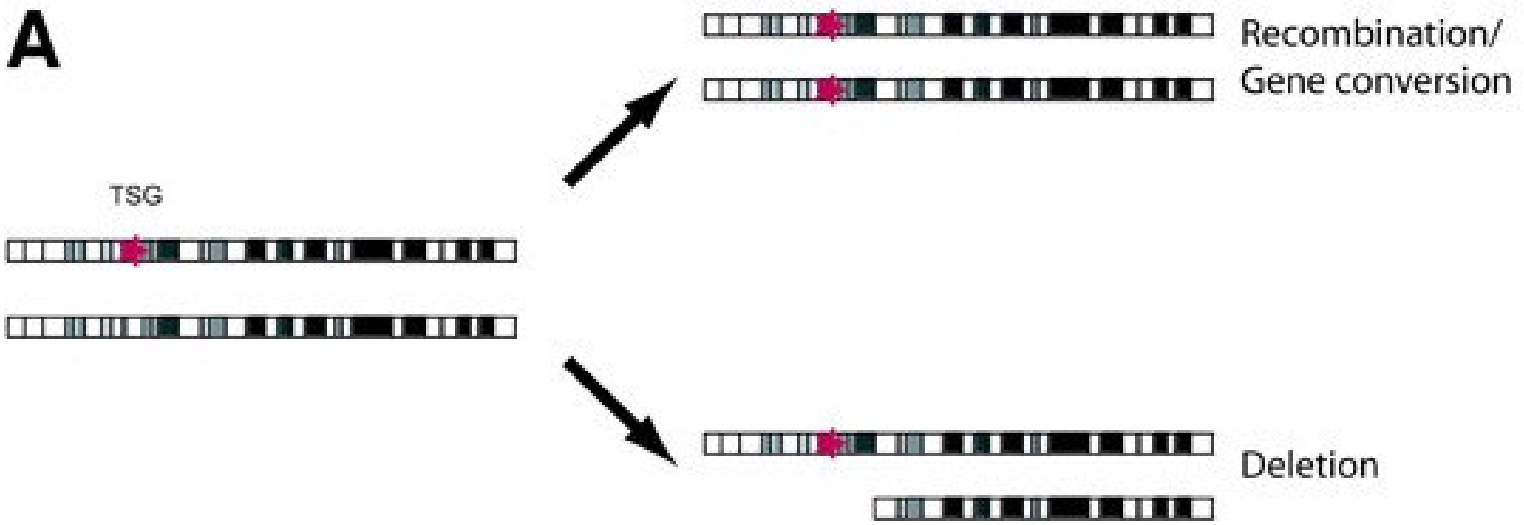
500K Mapping Arrays Enable Fine-Mapping of Gains and Losses



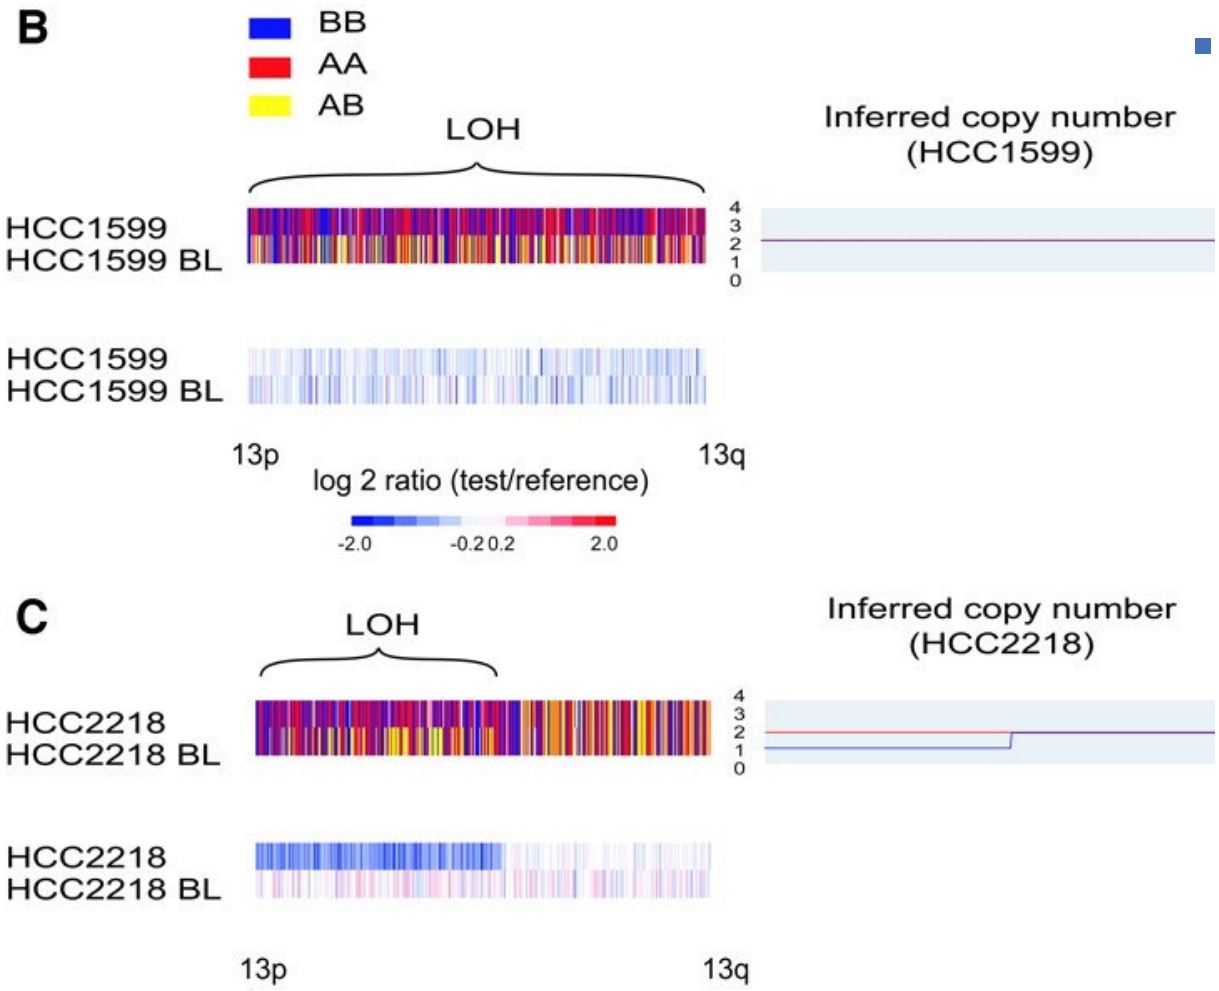
GeneChip® Mapping Arrays Distinguish Between Different LOH Mechanisms



- Different mechanisms can cause LOH (Panel A)
  - Point mutation
  - Hemizygous deletion
  - Mitotic disjunction
  - Mitotic recombination
  - Gene conversion

Zhao, X. et al. *Cancer Res* 64, 3060-71 (2004).

GeneChip® Mapping Arrays Distinguish Between Different LOH Mechanisms



- SNPs can distinguish different genetic mechanisms that lead to LOH (Panel B and C)
  - In HCC1599, chromosome 13 undergoes LOH, as determined by genotype analysis, but no change in copy number (Panel B)
  - In contrast, HCC2218, chromosome 13 undergoes LOH and copy number change

Zhao, X. et al. *Cancer Res* 64, 3060-71 (2004).

AFFYMETRIX
The Way Ahead.™

Limitations of Current Technologies

- Do not provide genotype information
  - LOH regions resulting from no copy change are not detected
- Limits of resolution, throughput, and manufacturing
  - CGH - BAC arrays are manufactured on-site
    - Potential for spot variation within and between sites
    - Different clones at different sites
    - Cannot be fabricated to industrial standards

Technology	Amount of DNA Required	Assay Time	Resolution	Probe Sequence Dependent
Karyotyping	++++	slow	5-10 Mb	No
FISH	+++	slow	1-5 Mb	Yes
CGH	+++	medium	1 Mb	No

- 10K and 500K can be used with Formalin-Fixed Paraffin-Embedded samples for CCN and LOH
- Imprinting patterns can be identified using Mapping Arrays (Apr 1, 2006)

CNAT4.0 Improvements

- Algorithm Improvements –Primary Focus
  - Enable CN and LOH analysis for **500K arrays**
  - Implement **algorithm improvements** to **improve data quality** and **reduce noise** seen with CNATv3
    - Data normalization
      - Probe level- Quantile normalization (e.g.BRLMM)
      - PCR Fragment Size (e.g.CNAG)
      - GC Content (e.g.CNAG).
    - Implement Hidden Markov Model – Defines discrete CN and LOH states
    - Enable **tumor**/ **normal comparison** as well as comparison to a standard or user defined reference set
  - Enable **allele specific analysis** in tumor/ normal analysis
- Software – Incremental Improvements
  - CNAT v3 infrastructure
    - Graphical display of data: Copy Number, Hidden Markov Model States, and Loss of Heterozygosity (LOH)
  - Whole Genome and Chromosome specific views
  - Multi sample view to facilitate identification of trends in copy number or LOH data
  - Dynamic filtering to enable thresholding of data
  - Direct Link to Affymetrix' Integrated Genome Browser (IGB) and easy export to UCSC Browser

AFFYMETRIX
The Way Ahead.™

CNAT 4.0 Key Features/ Benefits

Feature	Benefit
Support for all GeneChip Mapping Products (10K, 50K, 100K, 250K, and 500K arrays)	▪ Higher resolution provides better definition of genetic breakpoints
Allele-specific copy number estimation on matched tumor/normal samples	▪Enables detection of copy neutral events
Copy number and LOH determination using matched normal samples or by using a set of un-matched references	▪Enables comparison of matched tumor/ normal pairs as well as unmatched samples
Whole Genome and Chromosome specific views as well as Multi sample view	▪ to facilitate identification of trends in copy number or LOH data
Dynamic filtering of data	▪Enable the customer to set thresholds and visualize only data meeting that threshold
Export of data in wiggle format for uploading into UCSC browser	▪ Facilitates identification of candidate genes by linking data to genic annotation

The Way Ahead.™

Overview of Partek

- Partek Genomics Suite is Affymetrix GeneChip-compatible™ for gene expression analysis, exon expression analysis, promoter tiling array analysis, chromosomal copy number analysis, and SNP-based association analysis.
- For Copy Number Analysis:
  - LOH and Copy Number Estimation of imported 10K, 100K, and 500K data
  - Statistical methods for the identification of regions of amplification/deletion
  - Creates SNP or Gene Lists for regions of interest
  - Offers the ability to create diagnostic/prognostic prediction methods
  - Links to NetAffx, IGB, UCSC Genome Browser, GenBank, GEO, and others

AFFYMETRIX
The Way Ahead.™

GenePattern

- **GenePattern** is a powerful analysis workflow tool developed to support **multidisciplinary genomic research programs**.
  - It includes a collection of **analytic and visualization tools**, interfaces for the easy construction of analytic pipelines and integration of new modules without additional programming.
- GenePattern will soon provide the following support for the analysis of SNP microarray data:
  - Scaling of the data to normalize intensity levels across microarray chips.
  - Probe-level modeling to determine an intensity value for each SNP based on the intensity levels of the probes in each probe set.
  - Copy number (CN) calculation to determine the copy number of a target SNP. The calculation, which divides the intensity value of the target SNP by the intensity value of the normal SNP, is also called CN normalization or normalization with respect to normals.
  - Smoothing based on the R package GLAD (Gain and Loss Analysis of DNA), which detects the altered regions in the genomic pattern and assigns a status (normal, gained or lost) to each chromosomal region.
  - Additional analyses to support detection and visualization of LOH and CN alterations.
- Gene Pattern is available for **MacOS, Windows**, and **Linux** platforms

AFFYMETRIX
The Way Ahead.™

Applications of Genomic Copy Number Analysis

- Cancer Research - Somatic amplifications and deletions
- Cytogenetics - De novo and inherited germ line changes
- Association studies – inherited germ line changes

AFFYMETRIX
The Way Ahead.™

Implications of Chromosomal Rearrangements in Human Biology

- Oncogene amplification and/ or the deletion of tumor suppressor genes are hallmarks of cancer initiation and progression
- Copy number changes have recently been implicated in variable response to therapeutic agents.
- The frequency and biological significance of chromosomal mutations may be much greater than previously understood.
- New copy number methodologies are needed to provide
  - Higher marker resolution to facilitate detection of smaller aberrations and fine map boundaries.
  - Genotype information to enable detection of copy neutral events.
  - Ability to support data standards for submission.

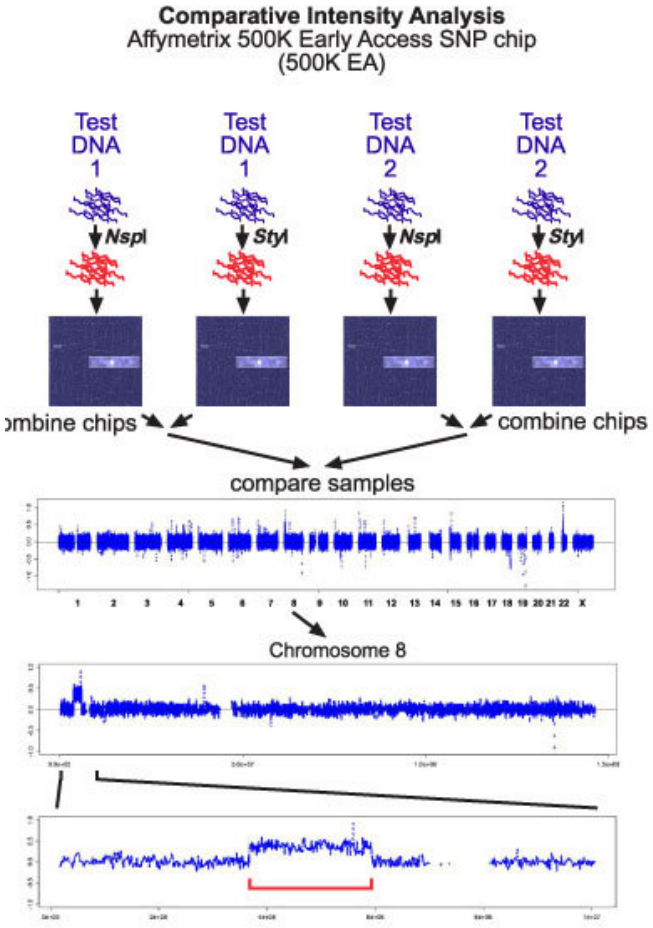
Association Studies

Affymetrix 500K Array Used to Generate First Copy Number Variation Map of the Human Genome - November 27, 2007

Global variation in copy number in the human genome. Nature 2006 Nov 23; 444: 444-454.



- **Characterized the frequency of germ line copy number variation (CNV) in the global population (270 HapMap samples) and constructed a first generation CNV map using 500K EA arrays**
- **Key Conclusions**
  - **CNVs are important in human diversity and evolution.** CNV regions encompass more nucleotide content than SNPs. 1447 CNV regions covering 360MB (12% of the genome) were identified in the HapMap populations.
  - **CNVs are important in human biology and disease.** CNV regions contained hundreds of genes (about 2900), functional elements and segmental duplications. Of the 2900 genes within CNV, 285 previously associated with disease.
  - **CNVs are valuable in genetic studies and provide complementary information to SNPs.** Dramatic variation in CNV patterns between HapMap populations and distinct linkage disequilibrium patterns exists for many identified CNVs.
  - ***In combination with SNP information, "CNV assessment should now become standard in the design of all studies of the genetic basis of phenotypic variation, including disease susceptibility."***

AFFYMETRIX
The Way Ahead.™

Whole Genome Copy Number Analysis Using 500K Mapping Arrays

- Increased density of markers provides higher resolution to detect and map boundaries of copy number changes
- Simultaneous collection of genotypes and copy number data allow for:
  - LOH clustering of samples
  - Distinguishing between different mechanism of LOH
  - Detection of copy neutral events, i.e. Uniparental disomy
- Combining of expression and copy number data facilitates identification of novel candidate genes

AFFYMETRIX®

The Way Ahead.™

New Products from Affymetrix for CNV-based Association Studies

AFFYMETRIX
The Way Ahead.™

The New Whole-Genome Human SNP 5.0

- Single Array configuration of the Mapping 500K Array Set
- Developed in collaboration with the Broad Institute of Harvard and the Massachusetts Institute of Technology
- In addition to SNP's, CNV's offer another set of markers that can be used to identify genetic associations with disease and basic human variability
- Consists of:
  - Approximately 500K SNPs from Mapping 500K
  - All SNPs back-compatible
  - 500,000 non-polymorphic tiling probes for the detection of CNV's (100,000 designed in 2,000 known regions of CNV)
- $250/sample
- Available in February 2007
- Copy Number Tool available from the Broad Institute mid-2007

AFFYMETRIX
The Way Ahead.™

The New Whole-Genome Human SNP 6.0

- Single Array configuration of the Mapping 500K Array Set including an additional ~500K HapMap and non-HapMap SNPs
- Developed in collaboration with the Broad Institute of Harvard and the Massachusetts Institute of Technology
- Consists of:
  - Approximately 500K SNPs from Mapping 500K
  - All SNPs back-compatible
  - Approximately 500K additional SNPs to boost genomic coverage for SNP-based association studies
  - Yet to defined number of non-polymorphic tiling probes for the detection of CNV's (100,000 designed in 2,000 known regions of CNV)
- Expected price – Less than $500/sample
- Available in July 2007
- Copy Number Tool available from the Broad Institute mid-2007

AFFYMETRIX
