Introduction

Antibodies or other proteins are often biotinylated with reagents such as Thermo Scientific EZ-Link Sulfo-NHS-LC-Biotin (Product No. 21335). Thermo Scientific HABA (4’-hydroxyazobenzene-2-carboxylic acid) is a reagent that enables a quick estimation of the mole-to-mole ratio of biotin to protein. To quantify biotin label incorporation, a solution containing the biotinylated protein is added to a mixture of HABA and avidin. Because of its higher affinity for avidin, biotin displaces the HABA from its interaction with avidin and the absorption at 500nm decreases proportionately. By this method, an unknown amount of biotin present in a solution can be evaluated in a single cuvette by measuring the absorbance of the HABA-avidin solution before and after addition of the biotin-containing sample. The change in absorbance relates to the amount of biotin in the sample.

Important Product Information

- Following any biotin-labeling reaction, the biotinylated protein sample to be assayed must be dialyzed or desalted to remove nonreacted and hydrolyzed biotinylation reagent.
- Samples must be in one of the recommended buffers (PBS or TBS, see Reagent Preparation Section) for the assay. Avoid buffers containing potassium (such as Modified Dulbecco’s PBS), which will cause precipitation in the assay. Other buffers may interfere and should not be used unless first validated by comparison to results using PBS or TBS.
- Slight color variation between the HABA/Avidin Premix microtubes does not affect product performance.

Procedure for Measuring the Level of Biotin Incorporation

Note: The biotin-labeled protein sample must be desalted or dialyzed to remove all traces of nonreacted and hydrolyzed biotinylation reagent before performing the HABA assay. (This assay detects total biotin in the solution.)

A. Additional Materials Required

- Avidin (Product No. 21121)
- 1N NaOH
- Phosphate Buffered Saline (PBS): 100mM sodium phosphate, 150mM sodium chloride; pH 7.2 (Product No. 28372)
- Cuvettes and spectrophotometer, or 96-well microplate and plate reader capable of measuring at 500nm.

B. Reagent Preparation

<table>
<thead>
<tr>
<th>Reagent</th>
<th>Preparation</th>
</tr>
</thead>
<tbody>
<tr>
<td>HABA Solution</td>
<td>Add 24.2mg HABA to 9.9mL of ultrapure water and then add 0.1mL of 1N NaOH. If the HABA does not completely dissolve, add another 0.1mL of 1N NaOH and filter solution before use. Store HABA solution at 4°C.</td>
</tr>
<tr>
<td>HABA/Avidin Solution</td>
<td>Add 10mg of avidin and 600µL of the HABA Solution to 19.4mL of PBS. Store solution at 4°C for up to 2 weeks.</td>
</tr>
</tbody>
</table>
C. Procedure (Cuvette Format)
1. Pipette 900µL of HABA/Avidin Solution into a 1mL cuvette and measure the absorbance at 500nm. The $A_{500}$ of this solution should be 0.9-1.3. Record the value as $A_{500}$ HABA/Avidin.
2. Add 100µL of biotinylated protein sample to the cuvette containing HABA/Avidin and mix well.
3. Measure the absorbance of the solution at 500nm. Once the absorbance value remains constant for at least 15 seconds, record the value as $A_{500}$ HABA/Avidin/Biotin Sample. If the $A_{500}$ HABA/Avidin/Biotin Sample is ≤ 0.3, dilute sample and repeat assay. Proceed to Calculations (Section E).

D. Procedure (Microplate Format)
1. Add 180µL of the HABA/Avidin Solution to a microplate well. Thoroughly mix plate on orbital shaker or equivalent.
2. Measure the absorbance of the solution in the well at 500nm and record the value as $A_{500}$ HABA/avidin.
3. Add 20µL of biotinylated sample to the well containing the HABA/Avidin Solution. Mix as described above.
4. Measure the absorbance of the solution in the well at 500nm and record the value as $A_{500}$ HABA/avidin/biotin sample once the value remains constant for at least 15 seconds. If the $A_{500}$ HABA/Avidin/Biotin Sample is ≤ 0.15, dilute sample and repeat assay.
5. Proceed to the Calculations (Section E).

E. Calculations for Moles of Biotin Per Mole of Protein

Note: The HABA Calculator, which is available from the Technical Resources menu from the website, will calculate the moles of biotin per mole of protein upon entering the required values.

These calculations are based on the Beer Lambert Law (Beer’s Law): $A_{\lambda} = \varepsilon_{\lambda} b C$

Where:
- $A_{\lambda}$ is the absorbance of the sample at a particular wavelength ($\lambda$). The wavelength for the HABA assay is 500nm. There are no units for absorbance.
- $\varepsilon_{\lambda}$ is the absorptivity or extinction coefficient at the wavelength ($\lambda$). For HABA/avidin samples at 500nm, pH 7.0 extinction coefficient is equal to 34,000M⁻¹cm⁻¹.
- $b$ is the cell path length expressed in centimeters (cm). A 10mm square cuvette has a path length of 1.0cm. In the microplate format with the recommended volumes, the path length is typically 0.5cm.
- $C$ is the concentration of the sample expressed in molarity (= mol/L = mmol/mL).

The values needed for calculating the number of moles of biotin per mole of protein or sample are as follows:
- Concentration of the protein or sample used, expressed as mg/ml
- Molecular weight (MW) of the protein, expressed as grams per mole (e.g., HRP = 40,000; IgG =150,000)
- Absorbance at 500nm for HABA/avidin reaction mixture ($A_{500}$ H\A)
- Absorbance at 500nm for HABA/avidin/biotin reaction mixture ($A_{500}$ H\A\B)
- Dilution factor, if the sample is diluted before adding to the HABA/avidin reaction mixture

1. Calculation #1 is for the concentration of biotinylated protein in mmol/mL (before any dilution for the assay procedure):

   \[
   \text{mmol protein per mL} = \frac{\text{protein concentration (mg/mL)}}{\text{MW of protein (mg/mmol)}} = \text{Calc#1}
   \]

2. Calculation #2 is for the change in absorbance at 500nm:

   - Cuvette:
     \[
     \Delta A_{500} = (0.9 \times A_{500} \text{ H\A}) - (A_{500} \text{ H\A\B}) = \text{Calc#2}
     \]

   Note: The cuvette format requires the 0.9 correction factor to adjust for dilution of the H\A mixture by the biotinylated protein sample. The microplate format does not require this correction factor because the...
• Microplate:

\[ \Delta A_{500} = (A_{500} \text{ H:A}) - (A_{500} \text{ H:A:B}) = \text{Calc#2} \]

3. Calculation #3 is for the concentration of biotin in mmol per ml of reaction mixture:

\[
\frac{\text{mmol biotin}}{\text{mL reaction mixture}} = \frac{\Delta A_{500}}{(34,000 \times b)} = \frac{\text{Calc#2}}{(34,000 \times b)} = \text{Calc#3}
\]

Note: \( b \) is the light path length (cm) of the sample. Use \( b = 1 \) with the cuvette format. Use \( b = 0.5 \) with the microplate format when using a standard 96-well plate and the volumes specified in the procedure. The exact path length is the height of the solution through which the plate reader measures the absorbance.

4. Calculation #4 is for the mmol of biotin per mmol of protein:

\[
\frac{\text{mmol biotin in original sample}}{\text{mmol protein in original sample}} = \frac{(\text{mmol per mL biotin in reaction mixture})(10)(\text{dilution factor})}{\text{mmol per mL protein in original sample}} = \frac{(\text{Calc#3}) \times 10 \times \text{dilution factor}}{\text{Calc#1}}
\]

Note: The original biotinylated protein sample was diluted 10-fold in the reaction mixture. Therefore, a multiplier of 10 is used in this step to convert the biotin concentration in the reaction mixture to the biotin concentration in the original sample. If the original sample was diluted before performing the assay, then the dilution factor must be used as well. Calculation #4 yields the biotin:protein molar ratio (average # of biotin molecules per protein molecule).

EXAMPLE: In this example, the labeled protein is IgG (MW 150,000) at 0.69 mg/mL. The absorbance measurements were \( A_{500} \text{ H:A} = 0.904 \) and \( A_{500} \text{ H:A:B} = 0.771 \).

1. \( \frac{\text{mmol biotinylated protein per mL}}{\text{mg/mL}} = \frac{0.69 \text{ mg/mL}}{150,000 \text{ mg/mmol}} = 4.6 \times 10^{-6} \)
2. \( \Delta A_{500} = (0.9 \times 0.904) - 0.771 = 0.0426 \)
3. \( \frac{\text{mmol biotin}}{\text{mL reaction mixture}} = \frac{0.0426}{34,000} = 1.25 \times 10^{-6} \)
4. \( \frac{\text{mmol biotin}}{\text{mmol protein}} = \frac{(1.25 \times 10^{-6}) \times 10}{4.6 \times 10^{-6}} = 2.72 \) biotin molecules per IgG molecule

Troubleshooting
