One Shot™ LB Agar Plates with 50 µg/mL Kanamycin

Catalog Number A55803

Pub. No. MAN0029966 Rev. A.0

WARNING! Read the Safety Data Sheets (SDSs) and follow the handling instructions. Wear appropriate protective eyewear, clothing, and gloves. Safety Data Sheets (SDSs) are available from thermofisher.com/support.

Product description

One Shot™ LB Agar Plates are pre-poured plates containing Luria-Bertani (LB) agar medium with 50 µg/mL kanamycin. LB agar is a solid bacterial growth medium used in molecular biology studies for the cultivation and maintenance of *Escherichia coli* strains. Added antibiotic allows selection of kanamycin resistant bacteria.

- Composition of the medium is based on formulation developed by Jeffrey H. Miller and contains twice as much sodium chloride as in the Lennox formulation [1].
- LB agar is a nutrient-rich medium containing casein peptone, yeast extract, sodium chloride, and agar. Casein peptone or tryptone is an enzymatic hydrolysate of casein. It supplies nitrogen, carbon, and amino acids. Yeast extract provides trace elements, vitamins (including B group vitamins), amino acids, and peptides. Sodium chloride supplies sodium cations for the membrane transport and maintains osmotic balance. Agar is a solidifying agent of the growth medium.
- Autoclaved glass plating beads are provided for convenient spreading of bacterial cells across the surface of the solid LB agar medium.

Contents

Catalog number	Amount
A55803	20 plates

The product is shipped as a box containing 20 pre-poured LB agar plates with antibiotic. Plates are divided into two stacks wrapped in a single layer of cellophane, containing 10 plates per stack. Each plate is 90 mm in diameter, contains 21 ± 2 mL of LB agar medium.

A 15 mL conical tube with autoclaved 4 mm glass plating beads is included in the box.

Storage and stability

Store at 2–14°C in the original packaging (cellophane wrapping and box). Protect from the light. Avoid freezing and overheating.

Note: Always store agar plates upside down.

Pre-poured LB agar plates are stable for three months when stored as directed.

Composition

Component	Concentration, g/L
Casein peptone	10.00
Yeast extract	5.00
Sodium chloride	10.00
Kanamycin	0.05
Agar	15.00

Procedure

Innoculate culture plate

Follow procedures established in the laboratory for bacterial culture preparation, inoculation and incubation. For more information, refer to relevant sources.

- Prior to inoculation, it is recommended to prewarm agar plates at 37°C in the incubator for 30 minutes. This step will help to dry out excessive moisture from the surface of the medium and provides better recovery of stressed bacterial cells.
- In case of built-up condensation, dry plates in the laminar flow hood with half-opened lids for 10–30 minutes.

How to use glass plating beads

Pipet bacterial cells onto the agar plate, then add 5–7 beads and vigorously move the plate back and forth. Make a couple of 360° rotations with 90° stops, until the surface of the medium seems dry. Discard the beads into the waste container by flipping the plate upside down.

Quality control

Physical and chemical quality control

- Color: Straw yellow
- Final pH: 7.0 ± 0.2 at 25°C

Microbiological control

- Inoculum level for productivity testing: a practicable range of 100±20 CFU of the target microorganism per plate with minimum number of 50 CFU per plate.
- Inoculum level for selectivity testing: a range of 10^4–10^6 CFU of the non-target microorganism per plate.
- Aerobic incubation at 37±1°C. Reading, calculation and interpretation of results after 18–24 hours.

Microorganism	Result
Escherichia coli ATCC® 25922, WDCM 00013	Inhibited
Escherichia coli ATCC® 35218	Inhibited
Escherichia coli DH5α containing pHSG298	Good growth (productivity ≥50%)

Test for absence of microbial contamination on plates

Testing is performed by incubation at 20–25°C and 30–35°C for 48 hours followed by visual inspection. Subsequent incubation under the same conditions for another seven days with following inspection.

Result: No growth.
