
Cytokine Bioassays

Research Use Only

Introduction

The biological activity of cytokines is commonly measured by cellular proliferation of primary cell cultures or in vitro adapted cell lines that are dependent and/or responsive to a specific growth factor. Other aspects of biological activity of cytokines include induction of further cytokine secretion, induction of killing, antiviral activity, degranulation, cytotoxicity, chemotaxis, and promotion of colony formation. In vitro assays to measure all of these activities are available. Here, we discuss general protocols for setting up bioassays to measure:

[Protocol A: Cytokine-induced proliferation](#)

[Protocol B: Cytokine-induced killing](#)

[Protocol C: Protection against viral effects](#)

[Protocol D: Cytokine-induced cytokine production](#)

General Notes

Many of the available indicator cell lines are responsive to more than one cytokine (e.g., CTLL2 cells respond to IL-2, IL-4, IL-15) and several cytokines share signaling receptors, so this should be taken into account during experimental design. Neutralizing antibodies for one particular cytokine are useful to demonstrate origin of response and attribute the activity to a particular cytokine. The dependence and responsiveness of cell lines should be carefully ascertained since continuous culture of cells may alter their sensitivity to growth factors. Bacterial endotoxins are effective inducers of some cytokines; hence, their presence in the bioassay cultures should be prevented. In order to obtain statistically significant values, samples should be performed in triplicate wells.

Useful websites

Cytokine Research Institute (<http://www.cytokineresearch.org/>)

Cytokine Research Institute is a website maintained by Justin Hoopes at Utah State. This website is to provide general information about the role cytokine play in disease pathogenesis.

Cytokine Reference (<http://apresslp.gvpi.net/apcyto/lpext.dll?f=templates&fn=main-h.htm&2.0>)

Cytokine Reference is a collection of information regarding cytokines and other mediators of immune response.

Cytokine Bioassays

Research Use Only

Protocol A: Cytokine-induced proliferation

Materials

- Indicator cell line (see [Quick Guide Chart](#) for a given cytokine)
- Culture Medium (RPMI-1640 supplemented with 10% FBS)
- 96-well flat-bottom culture plate (Costar Cat. No. 3595)
- MTT solution (Sigma Cat. No. M5655) 5mg/mL stock in PBS kept at room temperature (protect from light)
- MTT Lysing Solution 20% SDS/50% DMF

Instruments

- Pipettes and pipettors
- Humidified incubator
- 96-well micro test spectrophotometer

Experiment Duration

- 24-48 hour incubation (see [Quick Guide Chart](#))
- 1 hour assay preparation

Experimental Procedure

1. Add 100 μ L of Culture Medium to each well of the 96-well assay plate.
2. Dilute samples and standard (see [Quick Guide Chart](#) for standard range) by 2-fold serial dilution in the assay plate from row 2 to 12. Leave row 1 empty.
3. Wash indicator cells 3 times with RPMI-1640 and resuspend in Culture Medium at a density of $2-3.5 \times 10^5$ cells/mL (see [Quick Guide Chart](#)).
4. Add 100 μ L of cell suspension to each well.
5. Incubate cells for 24-48 hours (see [Quick Guide Chart](#)) at 37°C, 5% CO₂ in a humidified incubator.
6. Add 10 μ L/well of 5 mg/mL MTT solution to the plate and incubate for 4 hours.
7. Add 50 μ L/well of MTT Lysing Solution to the plate and incubate overnight.
8. Read plate at 570-650 nm.
9. Graph standard curve and analyze data.

Protocol B: TNF- α -Induced Killing of L929 Cell Line

Materials

- L929 mouse fibroblast line (ATCC Cat. No. CCL-1)
- Culture Medium (RPMI supplemented with 10% FBS)
- Assay Medium (RPMI supplemented with 2% FBS)
- 96-well flat-bottom culture plate (Costar Cat. No. 3595)
- Actinomycin D, 500 μ g/mL stock aliquot kept at minus 80°C (protect from light)

Cytokine Bioassays

Research Use Only

- MTT solution (Sigma Cat. No. M5655) 5 mg/mL stock in PBS kept at room temperature (protect from light)
- MTT Lysing solution, 20% SDS/50% DMF

Instruments

- Pipettes and pipettors
- Humidified incubator
- 96-well micro test spectrophotometer

Experiment Duration

- 24-hour incubation (see [Quick Guide Chart](#))
- 1 hour assay preparation

Experimental Procedure

1. Prepare L929 cell suspension at a density of 3.5×10^5 /mL in Assay Medium. Add 100 μ L/well to the 96-well assay plate and incubate overnight at 37°C, 5% CO₂ in a humidified incubator.
2. Dilute samples and standard (see [Quick Guide Chart](#) for standard range) by 2-fold serial dilution in the Assay Medium in 100 μ L/well in another 96-well plate from row 2 to 12. Leave row 1 empty.
3. Prepare a 4 μ g/mL working solution of the Actinomycin D by diluting the 500 μ g/mL stock 125 times in the Assay Medium. Keep Actinomycin D solution protected from light. Add 50 μ L of this working solution of Actinomycin D to each well.
4. Transfer 50 μ L of titrated samples and standard to the corresponding wells on the assay plate.
5. Incubate plate for 24 hrs at 37°C, 5% CO₂ in a humidified incubator.
6. Add 10 μ L/well of 5 mg/mL MTT solution to each well and incubate for 4 hours.
7. Add 50 μ L of MTT Lysing Solution to each well and incubate overnight.
8. Read plate at 570-650 nm. Graph standard curve and analyze data.

Protocol C: IFN- γ Protection from Viral Infection of Cell Lines

Materials

- L929 mouse fibroblast line (ATCC Cat. No. CCL-1) or A549 human lung carcinoma (ATCC Cat. No. CCL-185)
- Culture Medium (RPMI supplemented with 10% FBS)
- Assay Medium (RPMI supplemented with 2% FBS)
- 96-well flat-bottom culture plate (Costar Cat. No. 3595)
- EMC virus, 10^7 pfu/mL aliquots stock kept at minus 80°C
- MTT solution (Sigma Cat. No. M5655) 5 mg/mL stock in PBS kept at room temperature (protect from light)
- MTT Lysing solution, 20% SDS/50% DMF

Instruments

- Pipettes and pipettors
- Humidified incubator
- 96-well micro test spectrophotometer

Cytokine Bioassays

Research Use Only

Experiment Duration

- 40-hour incubation (see [Quick Guide Chart](#))
- 1 hour assay preparation

Experimental Procedure

1. Prepare L929 or A549 cell suspension at a density of 3.5×10^5 /mL in Assay Medium. Add 100 μ L/well to the 96-well plate and incubate overnight at 37°C, 5% CO₂ in a humidified incubator.
2. Dilute samples and standard (see [Quick Guide Chart](#) for standard range) by 2-fold serial dilution in the assay plate from row 2 to 12. Leave row 1 empty. Incubate the assay plate for 6 hours.
3. Aspirate supernatant from the wells carefully and add 100 μ L/well of EMC virus solution at a density of $1-4 \times 10^4$ pfu/mL (see [Quick Guide Chart](#) for human IFN- γ : 1/250 dilution of stock of 10^7 pfu/mL, for mouse IFN- γ , 1/1000 dilution of stock of 10^7 pfu/mL).
4. Incubate plate for 40 hours at 37°C, 5% CO₂ in a humidified incubator.
5. Add 10 μ L of 5 mg/mL MTT solution to each well and incubate for 4 hours.
6. Add 50 μ L of MTT Lysing Solution to each well and incubate overnight.
7. Read plate at 570-650 nm. Graph standard curve and analyze data.

Protocol D: Cytokine-Induced Cytokine Production

Materials

- Indicator cell line (see [Quick Guide Chart](#) for a given cytokine)
- Culture Medium (RPMI-1640 supplemented with 10% FBS)
- 96-well flat-bottom culture plate (Costar Cat. No. 3595)
- Cytokine ELISA pair or Ready-SET-Go! Reagent Set

Instruments

- Pipettes and pipettors
- Humidified incubator
- 96-well micro test spectrophotometer

Experiment Duration

- 24-48-hour incubation (see [Quick Guide Chart](#))
- 1 hour assay preparation

Experimental Procedure

1. Add 100 μ L of Culture Medium to each well of the 96-well assay plate.
2. Dilute samples and standard (see [Quick Guide Chart](#) for standard range) by 2-fold serial dilution in the assay plate from row 2 to 12. Leave row 1 empty.
3. Wash indicator cells 3 times with RPMI-1640 and resuspend in Culture Medium at a density of $2-3.5 \times 10^5$ cells/mL (see [Quick Guide Chart](#)).
4. Add 100 μ L of cell suspension to each well.

Cytokine Bioassays

Research Use Only

- Incubate cells for 24-48 hours (see [Quick Guide Chart](#)) at 37°C, 5% CO₂ in a humidified incubator.
- Harvest supernatants for determination of cytokine expression by ELISA.
- Follow ELISA protocol for target cytokine of interest.

Quick Guide: Cytokine Bioassays

The following tables summarize the conditions and reagents needed for [Mouse](#), [Human](#) and [Rat](#) cytokine bioassays.

Mouse Cytokine Bioassay Quick Guide									
Cytokine	Indicator Cells	Cell Density (x10 ⁵)	Feeder Cytokine	Assay Medium FBS(%)	Incubation Time (hours)	Specific Activity U/mg	Cytokine Top Conc. (ng/mL)	ED50 (pg/mL)	Read-Out/Comments
CCL5 (RANTES)	CHO-mCCR5	10		10	6		50	5-10x10 ³	Chemotaxis assay
Chemerin	CHO-mCMKLR	10			6		5-150	5-10x10 ⁴	Transmigration assay
Flt3 Ligand	M1 cells	3		10	48		2000	5-25x10 ⁴	IL-6 production, 1 ng/mL rmlLIF co-stim
G-CSF	M-NFS-60	2	rhM-CSF (10 ng/mL)	10	48		5	15-60	Proliferation
GM-CSF	MC/9 (ATCC CRL-8306)	2	mIL-3 (25 U/mL)	10	48	10 ⁷	10	100-300	Proliferation
HGF	mIMCD-3	1		2	96	5x10 ⁴	100	6-20x10 ³	Proliferation
HMGB1	RAW264.7	3.5		10	24	3x10 ²	10 ⁵	3-25x10 ⁶	TNFα production; with 10 ug/mL of Polymycin B
IFNα2	L929 (ATCC CCL-1)	3.5		2	40	10 ⁷	10	100	EMCV cell protection assay
IFNα4	L929 (ATCC CCL-1)	3.5		2	40	2x10 ⁷	0.1	75	EMCV cell protection assay
IFN-γ	L929 (ATCC CCL-1)	3.5		2	40	10 ⁷	10	100	EMCV cell protection assay

Cytokine Bioassays

Research Use Only

IL-17AF	NIH/3T3	3		10	48		250	1-10x10 ⁴	Mouse IL-6 production
IL-17F	NIH/3T3	3		10	48		2.5x10 ⁴	1-5x10 ⁶	Mouse IL-6 production
TNF-α	L929 (ATCC CCL-1)	3.5		2	24	2x10 ⁸	1	5	L929 cytotoxicity assay; Actinomycin D (2 ug/mL)

ED₅₀: 50% effective dose of cytokine (1 U/mL observed activity)

Table 3: Rat Cytokine Bioassay Quick Guide
