**TRIzol™ Reagent**

**Catalog Numbers** 15596026 and 15596018

**Doc. Part No.** 15596026.PPS  **Pub. No.** MAN0001271  **Rev.** B.0

---

**WARNING!** Read the Safety Data Sheets (SDSs) and follow the handling instructions. Wear appropriate protective eyewear, clothing, and gloves. Safety Data Sheets (SDSs) are available from thermoﬁsher.com/support.

---

**Product description**

Invitrogen™ TRIzol™ Reagent is a ready-to-use reagent, designed to isolate high quality total RNA (as well as DNA and proteins) from cell and tissue samples of human, animal, plant, yeast, or bacterial origin, within one hour. TRIzol™ Reagent is a monophasic solution of phenol, guanidine isothiocyanate, and other proprietary components which facilitate the isolation of a variety of RNA species of large or small molecular size. TRIzol™ Reagent maintains the integrity of the RNA due to highly effective inhibition of RNase activity while disrupting cells and dissolving cell components during sample homogenization. TRIzol™ Reagent allows for simultaneous processing of a large number of samples, and is an improvement to the single-step RNA isolation method developed by Chomczynski and Sacchi (Chomczynski and Sacchi, 1987).

TRIzol™ Reagent allows to perform sequential precipitation of RNA, DNA, and proteins from a single sample (Chomczynski, 1993). After homogenizing the sample with TRIzol™ and the homogenate is allowed to separate into a clear upper aqueous layer with isopropanol. DNA is precipitated from the interphase/organic layer with ethanol. Protein is precipitated from the phenol-ethanol supernatant by isopropanol precipitation. The precipitated RNA, DNA, or protein is washed to remove impurities, and then resuspended for use in downstream applications.

- Isolated RNA can be used in RT-PCR, Northern Blot analysis, Dot Blot hybridization, poly(A)+ selection, in vitro translation, RNase protection assay, and molecular cloning.
- Isolated DNA can be used in PCR, Restriction Enzyme digestion, and Southern Blots.
- Isolated protein can be used for Western Blots, recovery of some enzymatic activity, and some immunoprecipitation.

For DNA isolation, see the TRIzol™ Reagent (DNA isolation) User Guide (Pub. No. MAN0016385).

TRIzol™ Reagent can also be used with Phasemaker™ Tubes (Cat. No. A33248) to isolate RNA. Phasemaker™ Tubes creates a solid barrier between the organic and aqueous phases of the TRIzol™ Reagent following sample homogenization which makes separation of phases easier. See the TRIzol™ Reagent and Phasemaker™ Tubes Complete System User Guide (Pub. No. MAN0016163) for the full protocol.

TRIzol™ Reagent can also be used with the PureLink™ RNA Mini Kit (Cat. No. 12183018A) which uses spin columns instead of ethanol precipitation to purify the RNA. For additional information, see the PureLink™ RNA Mini Kit User Guide (Pub. No. MAN0000406).

[1] Fresh tissues or tissues stored in RNAlater® Stabilization Solution (Cat. No. AM7020).
Procedural guidelines

- Perform all steps at room temperature (20–25°C) unless otherwise noted.
- Use cold TRIzol™ Reagent if the starting material contains high levels of RNase, such as spleen or pancreas samples.
- Use disposable, individually wrapped, sterile plastic ware and sterile, disposable RNase-free pipettes, pipette tips, and tubes.
- Wear disposable gloves while handling reagents and RNA samples.
- Use disposable, individually wrapped, sterile plastic ware and sterile, disposable RNase-free pipettes, pipette tips, and tubes.
- Always use proper microbiological aseptic techniques when working with RNA.
- Use RNase Zap™ RNase Decontamination Solution (Cat. no. AM9780) to remove RNase contamination from work surfaces and non-disposable items such as centrifuges and pipettes used during purification.
- Ensure that all materials that come into contact with TRIzol™ Reagent are compatible with phenol, guanidine isothiocyanate, and chloroform.

Lyse samples and separate phases

1. Lyse and homogenize samples in TRIzol™ Reagent according to your starting material.

   a. Add 1 mL of TRIzol™ Reagent per 50–100 mg of tissue to the sample and homogenize using a homogenizer.
   b. Add 0.3–0.4 mL of TRIzol™ Reagent per 1 × 10^5–10^7 cells directly to the culture dish to lyse the cells.
   c. Pipet the lysate up and down several times to homogenize.
   d. Remove growth media.

2. (Optional) If samples have a high fat content, centrifuge the lysate for 5 minutes at 12,000 × g at 4–10°C, then transfer the clear supernatant to a new tube.

3. Incubate for 5 minutes to allow complete dissolution of the nucleoproteins complex.

4. Add 0.2 mL of chloroform per 1 mL of TRIzol™ Reagent used for lysis, securely cap the tube, then thoroughly mix by shaking.

5. Incubate for 2–3 minutes.

6. Centrifuge the sample for 15 minutes at 12,000 × g at 4°C.

   The mixture separates into a lower red phenol-chloroform, an interphase, and a colorless upper aqueous phase.

7. Transfer the aqueous phase containing the RNA to a new tube by angling the tube at 45° and pipetting the solution out.

   IMPORTANT! Avoid transferring any of the interphase or organic layer into the pipette when removing the aqueous phase.

Proceed directly to “Isolate RNA” on page 2.

To isolate DNA or protein, save the interphase and organic phase. See the TRIzol™ Reagent (DNA isolation) User Guide (Pub. No. MAN0016385) or see “Isolate proteins” on page 3 for detailed procedures. The organic phase can be stored at 4°C overnight.

Isolate RNA

1. Precipitate the RNA

   a. (Optional) If the starting sample is small (<10^6 cells or <10 mg of tissue), add 5–10 µg of RNase-free glycogen as a carrier to the aqueous phase.

   Note: The glycogen is co-precipitated with the RNA, but does not interfere with subsequent applications.

   b. Add 0.5 mL of isopropanol to the aqueous phase, per 1 mL of TRIzol™ Reagent used for lysis.

   c. Incubate for 10 minutes at 4°C.

   d. Centrifuge for 10 minutes at 12,000 × g at 4°C.

   e. Discard the supernatant with a micropipettor.

2. Wash the RNA

   a. Resuspend the pellet in 1 mL of 75% ethanol per 1 mL of TRIzol™ Reagent used for lysis.

   Note: The RNA can be stored in 75% ethanol for at least 1 year at –20°C, or at least 1 week at 4°C.

   b. Vortex the sample briefly, then centrifuge for 5 minutes at 7500 × g at 4°C.

   c. Discard the supernatant with a micropipettor.

   d. Vacuum or air dry the RNA pellet for 5–10 minutes.

   IMPORTANT! Do not dry the pellet by vacuum centrifuge. Do not let the RNA pellet dry, to ensure total solubilization of the RNA. Partially dissolved RNA samples have an A260/A280 ratio <1.6.

3. Solubilize the RNA

   a. Resuspend the pellet in 20–50 µL of RNase-free water, 0.1 mM EDTA, or 0.5% SDS solution by pipetting up and down.

   IMPORTANT! Do not dissolve the RNA in 0.5% SDS if the RNA is to be used in subsequent enzymatic reactions.

   b. Incubate in a water bath or heat block set at 55–60°C for 10–15 minutes.

   Proceed to downstream applications, or store the RNA at –70°C.
Determine the RNA yield using one of the following methods.

<table>
<thead>
<tr>
<th>Method</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| Absorbance   | 1. Dilute sample in RNase-free water, then measure absorbance at 260 nm and 280 nm.  
               | 2. Calculate the RNA concentration using the formula A260 × dilution × 40 = µg RNA/mL.  
               | 3. Calculate the A260/A280 ratio. A ratio of ~2 is considered pure.  
               | RNA samples can be quantified by absorbance without prior dilution using the NanoDrop Spectrophotometer. Refer to the instrument’s instructions for more information. |
| Fluorescence | quantify RNA yield using the appropriate Qubit or Quant-iT RNA Assay Kit [Cat. Nos. Q32852, Q10210, Q33140, or Q10213]. Refer to the kit’s instructions for more information. |

### Isolate proteins

Isolate the proteins from the organic phase saved from “Isolate RNA” on page 2 using either “Precipitate the proteins” on page 3 or “Dialyse the proteins” on page 4.

1. **Precipitate the proteins**
   - a. Remove any remaining aqueous phase overlying the interphase.
   - b. Add 0.3 mL of 100% ethanol per 1 mL of TRIzol™ Reagent used for lysis.
   - c. Cap the tube, mix by inverting the tube several times.
   - d. Incubate for 2–3 minutes.
   - e. Centrifuge for 5 minutes at 2000 × g at 4°C to pellet the DNA.
   - f. Transfer the phenol-ethanol supernatant to a new tube.
   - g. Add 1.5 mL of isopropanol to the phenol-ethanol supernatant per 1 mL of TRIzol™ Reagent used for lysis.
   - h. Incubate for 10 minutes.
   - i. Centrifuge for 10 minutes at 12,000 × g at 4°C to pellet the proteins.
   - j. Discard the supernatant with a micropipettor.

2. **Wash the proteins**
   - a. Prepare a wash solution consisting of 0.3 M guanidine hydrochloride in 95% ethanol.
   - b. Resuspend the pellet in 2 mL of wash solution per 1 mL of TRIzol™ Reagent used for lysis.
   - c. Incubate for 20 minutes.
     - **Note:** The proteins can be stored in wash solution for at least 1 month at 4°C or for at least 1 year at –20°C.
   - d. Centrifuge for 5 minutes at 7500 × g at 4°C.
   - e. Discard the supernatant with a micropipettor.
   - f. Repeat step 2b–step 2e twice.
   - g. Add 2 mL of 100% ethanol, then mix by vortexing briefly.
   - h. Incubate for 20 minutes.
   - i. Centrifuge for 5 minutes at 7500 × g at 4°C.
   - j. Discard the supernatant with a micropipettor.
   - k. Air dry the protein pellet for 5–10 minutes.
     - **IMPORTANT!** Do not dry the pellet by vacuum centrifuge.

3. **Solubilize the proteins**
   - a. Resuspend the pellet in 200 µL of 1% SDS by pipetting up and down.
     - **Note:** To ensure complete resuspension of the pellet, we recommend that you incubate the sample at 50°C in a water bath or heat block.
   - b. Centrifuge for 10 minutes at 10,000 × g at 4°C to remove insoluble materials.
   - c. Transfer the supernatant to a new tube.
   - Measure protein concentration by Bradford assay (SDS concentration must be <0.1%), then proceed directly to downstream applications, or store the sample at –20°C.
**Dialyse the proteins**

1. Remove any remaining aqueous phase overlying the interphase.
2. Add 0.3 mL of 100% ethanol per 1 mL of TRIzol™ Reagent used for lysis.
3. Cap the tube, mix by inverting the tube several times.
4. Incubate for 2–3 minutes.
5. Centrifuge for 5 minutes at 2000 × g at 4°C to pellet the DNA.
6. Load the phenol-ethanol supernatant into the dialysis membrane.
   - **Note:** The phenol-ethanol solution can dissolve some types of dialysis membranes (cellulose ester, for example). Test dialysis tubing with the membrane to assess compatibility before starting.
7. Dialyze the sample against 3 changes of 0.1% SDS at 4°C. Make the first change of solution after 16 hours, the second change 4 hours later (at 20 hours), and the final change 2 hours later (at 22 hours).
   - **Note:** A SDS concentration of at least 0.1% is required to resolubilize the proteins from the pellet. If desired, the SDS can be diluted after solubilization.
8. Centrifuge the dialysate for 10 minutes at 10,000 × g at 4°C.
9. Transfer the supernatant containing the proteins to a new tube.
10. (Optional) Solubilize the pellet by adding 100 µL of 1% SDS and 100 µL of 8 M urea.

Proceed directly to downstream applications, or store the sample at –20°C.
