

Inorganics

Library Listing – 1,803 spectra

This library provides spectra of inorganic and related compounds from around the world. It consists of minerals, boron compounds, general inorganic substances and inorganic materials of commercial interest. All of the samples were run as KBr pellets or mulls.

The Inorganics Library contains a total of 1,803 spectra, including 600 minerals, 296 boron compounds, 697 other inorganic substances and 210 commercial materials. The compounds represented in the library include inorganic compounds and other materials found in a typical inorganic laboratory. Some examples are organometallic compounds, salts of organic acids, metal complexes with organic ligands, common organic ligands, such as EDTA, organic indicators and dyes used in inorganic analysis and a few commonly used organic compounds. The commercial materials include cements, ceramics, porcelain, clay, glass and other raw materials. The Minerals Library is a 600 spectra subset of this library.
